CLAUDE FOR BUSINESS

Six things you can build in Claude, and when each one is worth it

Katie Robbert, CEO

MAICON 2026 | 3-Hour Workshop

TRUST INSIGHTS

Katie Robbert 12:36 PM

I'm just a girl, sitting in front of Claude on my desktop, asking it for the love of Pete stop moving buttons on a daily basis for no f$#^ing reason.

😆 5 🤣 11 ☝️ ☝️ 3 🙌 1

4 replies Last reply 17 hours ago

WHAT YOU NEED TODAY

You need a paid Claude plan. Pro, Max, Team, or Enterprise.

The free plan doesn't include scheduled tasks or Plugins. That's the only hard requirement.

- If you can install software, open the Claude desktop app and sign in. One app covers Claude and Code
- If you can't, sign in at claude.ai in your browser. Every exercise today works there
- Download the workbook and the sample pack, and put them on your desktop so they're easy to find
- Switch the model to Sonnet. It's set per conversation, so check it again every time you start a new one
- Turn incognito off (the ghost icon). Incognito can't make files or run code, and it isn't available in Projects. Exercises 2 - 6 won't work with it on

If your organization blocks installs, that is genuinely fine. The next few slides show exactly what does and doesn't change.

TRUST INSIGHTS

YOUR SCREEN MAY NOT MATCH MINE

Anthropic merged Chat and Cowork into one Claude on 16 September. It's still rolling out.

If you're on	What you'll probably see today
Pro or Max	One window. A Claude / Code toggle, no Cowork tab
Team	Rolling out now. Some accounts are merged, some aren't yet
Enterprise	Owed 30 days' notice, so you may still have tabs
Free	Still separate, and the merge is coming

Same capabilities either way. If you have no Cowork tab, you haven't lost anything. It became the default.

As of 30 September 2026. If yours looks different, that's the point of this slide.

TRUST INSIGHTS

Stuck on setup?
Flag Sunny Hunt.
She's walking the room and here to help!

Wave “Hi!” to your ghost. Maybe name them.

There will be times when you want to use Incognito Mode.

Learn more here: https://support.claude.com/en/articles/12260368-use-incognito-chats

WHICH MODEL, AND WHAT IT COSTS

There's a dial. Most of you won't touch it, but whoever pays should know it exists.

Model	Reach for it when
Fable	The frontier. Long agentic runs, and work where getting it right matters more than getting it fast
Opus	Heavy reasoning. Costs less than Fable and more than Sonnet
Sonnet	The one we're using today. Capable enough for the large majority of what you'll do
Haiku	Speed and volume matter more than depth

Heavier models consume your usage faster, and running your heaviest model on routine work is how teams burn through limits by Wednesday.

TRUST INSIGHTS

WHEN EACH MODEL LAST CHANGED

The tiers don't move together, and the heaviest model isn't always the newest one.

Model	Version	Last updated	Knows up to
Fable	5.1	1 September 2026	June 2026
Opus	5.5	22 September 2026	June 2026
Sonnet	5.5	28 September 2026	January 2026
Haiku	5.5	7 October 2026	June 2026

Sonnet, the one we're using today, stops at January 2026, nine months before this room. Anything since then, it doesn't know unless you tell it.

As of 8 October 2026

MAKE YOUR USAGE LAST

Four habits that stretch your plan further.

- Sonnet by default. Save the heavier models for work that needs them
- Start a new conversation for a new topic. Long conversations cost more every turn
- Schedule on the cadence the answer actually changes, not daily
- For the same edit across a lot of files, use Code. It's cheaper than doing it one at a time

YOUR DATA HERE

Swap in your usage chart or numbers

TRUST INSIGHTS

START WITH THE DESKTOP APP

Same account, same sessions, same files. They sync across all three.

DESKTOP

Where you build

Reaches the cloud AND your computer

- Reads and writes files in folders you connect
- Local connectors and your own filesystem
- Browser use and computer use

WEB

Also where you build

Reaches the cloud

- All six exercises work here
- Cloud connectors: Drive, SharePoint, Slack
- Upload and download instead of a folder

MOBILE

Where you check in

Reaches the cloud

- Start a task, steer it, read what came back
- Laptop sessions are waiting here
- Artifacts have their own tab, but build them on a laptop

The desktop app is the only one that reaches your own computer. If you can install it, do. If your IT department says no, you are not missing a single exercise today.

TRUST INSIGHTS

THE WEB APP DOES ALMOST EVERYTHING

This is the one I want you to hear, because I expect some of you are on it.

DESKTOP

Where you build

Reaches the cloud AND your computer

- Reads and writes files in folders you connect
- Local connectors and your own filesystem
- Browser use and computer use

WEB

Also where you build

Reaches the cloud

- All six exercises work here
- Cloud connectors: Drive, SharePoint, Slack
- Upload and download instead of a folder

MOBILE

Where you check in

Reaches the cloud

- Start a task, steer it, read what came back
- Laptop sessions are waiting here
- Artifacts have their own tab, but build them on a laptop

Every exercise today works in a browser. You upload your files instead of pointing at a folder. Different step, same result.

TRUST INSIGHTS

YOUR PHONE IS FOR CHECKING IN

Not for building. It's the same Claude, on a small screen with a sync lag.

DESKTOP

Where you build

Reaches the cloud AND your computer

- Reads and writes files in folders you connect
- Local connectors and your own filesystem
- Browser use and computer use

WEB

Also where you build

Reaches the cloud

- All six exercises work here
- Cloud connectors: Drive, SharePoint, Slack
- Upload and download instead of a folder

MOBILE

Where you check in

Reaches the cloud

- Start a task, steer it, read what came back
- Laptop sessions are waiting here
- Artifacts have their own tab, but build them on a laptop

Kick a task off at your desk and read what came back on the train. Artifacts have their own tab on mobile, but it's easier to build on a laptop.

TRUST INSIGHTS

WHY THEY'RE DIFFERENT

You'll want this answer ready, because somebody always asks it.

CLAUDE RUNS SOMEWHERE ELSE

The model lives in Anthropic's cloud. Laptop, browser or phone, the thinking happens on their servers. No surface gives you a smarter Claude.

WHAT CHANGES IS REACH

Your hard drive can only be touched by a program running on your machine. A browser tab is sandboxed on purpose. That is every browser, not a decision Anthropic made.

DESKTOP IS A BRIDGE

Leave it open and a session you started on your phone reaches your files through it. It isn't that the web can't. It's that something has to be running on the computer.

Installing the desktop app doesn't give you a better Claude. It gives Claude hands on your computer.

TRUST INSIGHTS

A FEW OPTIONAL EXTRAS

None of these are required. Handle them if they apply to you and ignore them otherwise.

- Connectors are optional. Every scenario has sample data you can use instead
- If you prefer the terminal, Claude Code runs there too. Nothing today requires it, and Windows users who want it need Git for Windows
- **On Windows**, the desktop app needs Windows' Virtual Machine Platform turned on to work with your files. If you see a "Missing HCS services" error, that's your IT team's to fix. Use the web app today
- Mobile works for following along, but you'll want a laptop to build anything

Stuck on setup? Raise your hand. Help is on the way!

TRUST INSIGHTS

WHO'S IN THE ROOM

MAICON registration: 942 people across the whole conference. Most of you are past the basics, and you'll still find gaps.

2%

describe themselves as just curious

55%

are past experimenting

43%

work at companies under 100 people

- Almost nobody here is new to AI. Knowing the tools and knowing how they fit together are different things
- Only a quarter of the conference is marketing services. Manufacturing, healthcare, education and finance together are larger
- So, less on what AI is, and more on what to build, what it costs, and who should own it

From MAICON 2026 registration, conference-wide. Not a head count of this room.

TRUST INSIGHTS

WHAT YOU GET FOR THREE HOURS

The question everyone is asking is how to measure the ROI of AI. This is how you start answering it.

- You'll be able to look at a task on your plate and say whether it's worth handing to Claude at all, which of the six things it needs, and what a good answer looks like when it comes back.
- You'll be able to write the prompt that gets usable work the first time, because you'll know what a prompt has to contain rather than having memorized one of mine.
- You'll be able to brief somebody else to build it, and tell when what comes back is wrong. If you manage people who use AI, that last one is the whole job.

Everything you don't reach is in the workbook with the prompt already written.

TODAY'S AGENDA

One foundation, then six things you can build. Each one stands alone or works together.

Exercise	What you build	Why it's worth more than the last
0. Before you build	A scored use case and five answers	You know it's worth building before you open AI
1. Research	A deep-research brief	You stop guessing and start from evidence
2. Project	A workspace that remembers	You stop re-explaining your business every session
3. Artifact	Something you can see and send	The output becomes a thing, not a chat message
4. Skill	An encoded process	It repeats without you rewriting the prompt
5. Plugin	A package for your team	It stops being your personal trick
6. Scheduled task	A job that runs itself	It happens whether or not you remember

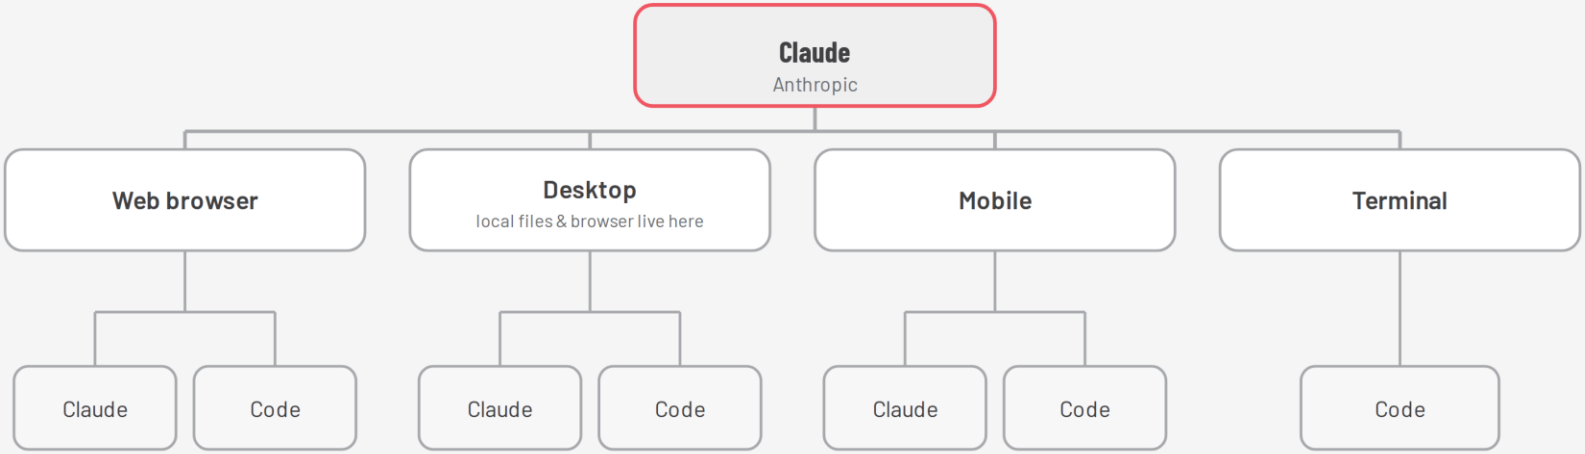

FOUNDATIONAL, NOT FRAGILE

Models and menus will keep changing. The judgment you build today doesn't expire.

- Model names will change. The decision of which surface to use, and when something deserves to become a Skill, does not.
- The interface will move. Buttons and menus get reorganized constantly, which is normal for software moving this fast.
- What we're teaching is a pattern. Scope the work, pick the surface, build it, verify it, then decide whether it should repeat.
- Leave fluent in the pattern rather than memorized on a screenshot, and you'll adapt in minutes when this changes next month.

THE CLAUDE ECOSYSTEM

Four surfaces, two tools.

The interactive map you're taking home has this too. It's clickable, and it works offline.

CLAUDE IS HOME BASE TODAY

All six exercises happen in the same place.

CLAUDE

Exercises 1 through 6. Research, Projects, artifacts, Skills, Plugins and scheduled tasks. Where you'll live today.

CODE

An optional path in Exercise 6, and the detour after it. Runs on web, desktop, mobile and the terminal.

If you only remember one thing from the orientation, open Claude and everything else follows.

ALSO OUT THERE

Not covered today, but worth knowing they exist if you decide what gets bought.

Product	What it is
Claude Design	AI-native visual design tool
Claude Science	Workbench for research teams
Claude Security	Code vulnerability scanning
Claude for Life Sciences	Lab and research workflows
Claude for Small Business	43 workflows, 27 integrations

Product	What it is
Claude for Financial Services	Financial data and agent templates
Claude for Legal	Contract review, research, diligence
Claude for Education	Campus access with Learning mode
Claude for Government	FedRAMP High and Gov models
Claude for Teachers	Free K-12 Enterprise offering

THE FIVE STAGES OF AI MATURITY

A Trust Insights framework. Find yourself on this curve before you pick anything to build.

Stage	Mode	Human effort	What it means
1 Done by You	Workflow	100%	You do the work. AI isn't in the loop.
2 Done with You	Automation	60-70%	AI drafts and assists. Most daily tasks belong here.
3 Done for You	Agent	10-20%	It runs the process. You review and approve.
4 Done without You	Autonomous	1-5%	It runs unsupervised. Needs real governance.
5 Done Ahead of You	Anticipatory	0%	It acts before you ask. Long horizon.

Most of this room is at Stage 2. The goal today isn't Stage 5. It's moving one stage, deliberately, on one real task.

TRUST INSIGHTS

EXERCISE 0

BEFORE YOU BUILD ANYTHING

YOUR USE CASE

Everything you build today runs on this. Pick something you actually repeat, not something impressive.

1 THE ONE THING

I want to walk out able to do

2 WHY IT MATTERS

What does it cost to leave it the way it is?

3 HOW YOU'LL KNOW

What tells you it worked?

PICK YOUR SCENARIO IF YOU WANT TO USE SYNTHETIC DATA

Competitive analysis | **Content and editorial** | **Reporting and performance** | **Process and documentation** | **Meetings to actions**

TRUST INSIGHTS

IS IT WORTH IT? SCORE IT WITH TRIPS

A Trust Insights framework. Score each one from 1 to 5, then average.

	Dimension	The question
T	Time	How much of your week does this eat?
R	Repetitiveness	How often does it recur in the same shape?
I	Importance	How much does it matter if it's done badly?
P	Pain	How much do you dread it?
S	Sufficient data	Do you have the material Claude would need?

Below 3, leave it alone. Automating low-value work is how AI projects earn a bad reputation.

TRUST INSIGHTS

TRIPS, FILLED IN

The task I scored: our quarterly competitive review, which I had been doing by hand.

Dimension	My score	Why
Time	4	Two full days a quarter, most of it collecting numbers
Repetitiveness	5	Same four competitors, same metrics, every quarter
Importance	4	It goes to leadership and informs where budget lands
Pain	5	I put it off every single time
Sufficient data	3	The numbers exist, but they live in six places

Average 4.2, so it's worth building. The 3 on Sufficient data is the interesting score, because that tells me Exercise 2 matters more than I thought.

Your workbook has a blank version of this table on page 5. Score your own task there before we go further.

FIVE QUESTIONS BEFORE YOU BUILD

The 5P Framework by Trust Insights™ turns a scored task into requirements.

	What you're deciding
Purpose	What decision does this work have to support?
People	Who reads the output, and who does the building?
Process	Is there a standard for this, or does it live in somebody's head?
Platform	Where does the finished thing need to live?
Performance	How will you know whether it worked?

Whichever question you can't answer is the one to fix first. That's the entire routing rule.

TRUST INSIGHTS

THE 5P FRAMEWORK BY TRUST INSIGHTS™, FILLED IN

Same task. The competitive review I just scored on TRIPS.

	My answer
Purpose	Decide where next quarter's budget goes
People	Our leadership team reads it. I build it
Process	No standard. It's in my head and slightly different every time
Platform	Something the team can open without me in the room
Performance	We can name the one gap worth closing, and defend the numbers

Process was my weakest answer, which is why this ended up as a Skill in Exercise 4 rather than a one-off report.

Blank version on page 6 of your workbook. Answer these five for your own task now.

WHAT'S READY FOR YOU

Five scenarios, each with sample data and a prompt for every exercise. Or bring your own.

Scenario	What you get
Competitive analysis	Sixteen metrics across four organizations, already collected
Content and editorial	A thin brand voice note and three published posts
Reporting and performance	Five months of channel data, thirty rows
Process and documentation	Messy onboarding notes with no owner and two parallel paths
Meetings to actions	A twenty-minute pipeline review with four people

All of it is synthetic except the competitive numbers, which are ours and already public. Using the samples isn't the beginner path, it's the sensible one on conference wifi.

EXERCISE 0: BEFORE YOU BUILD ANYTHING

SCORE IT.

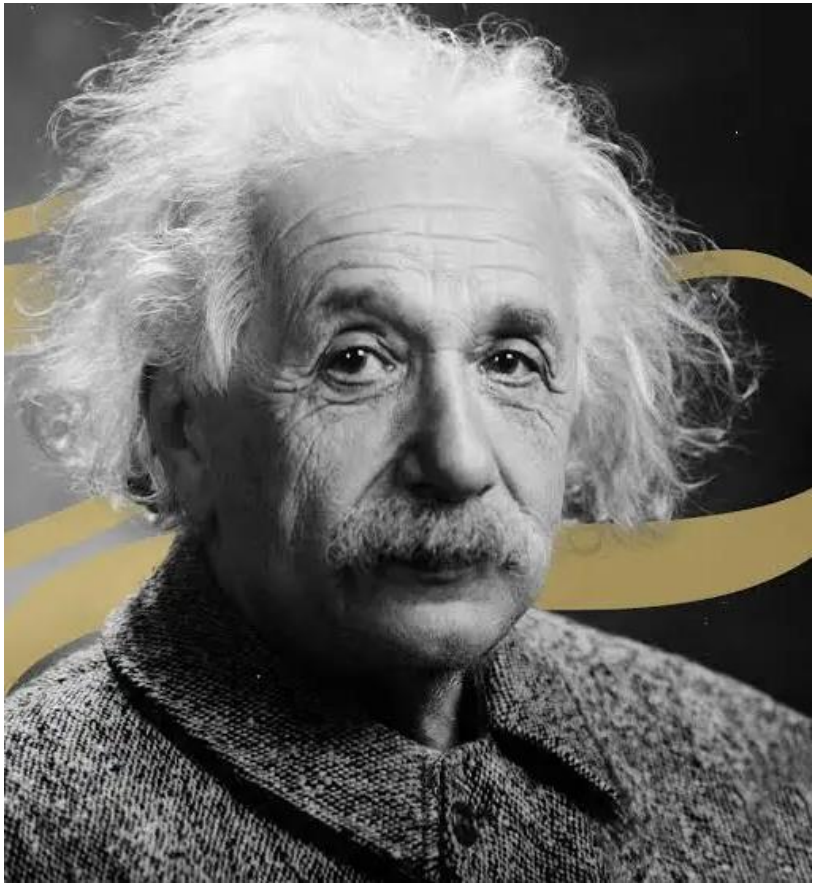

Find the use case you jotted down (or jot it down now)

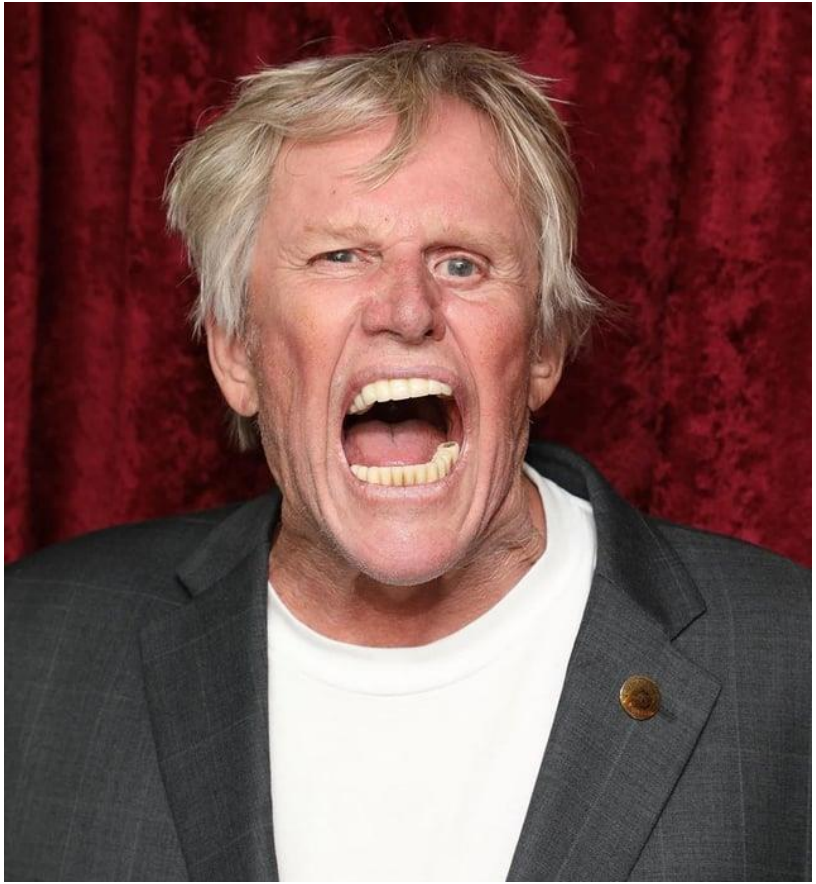

This is the work you do before you open AI. Score your use case on TRIPS and answer the five questions in your workbook.

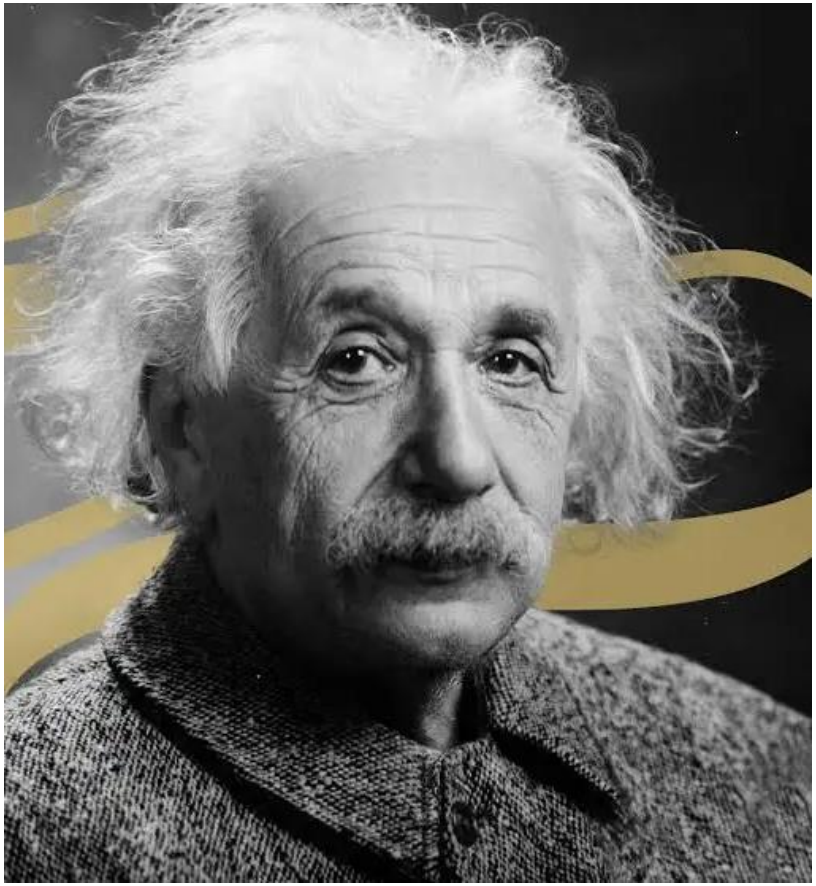

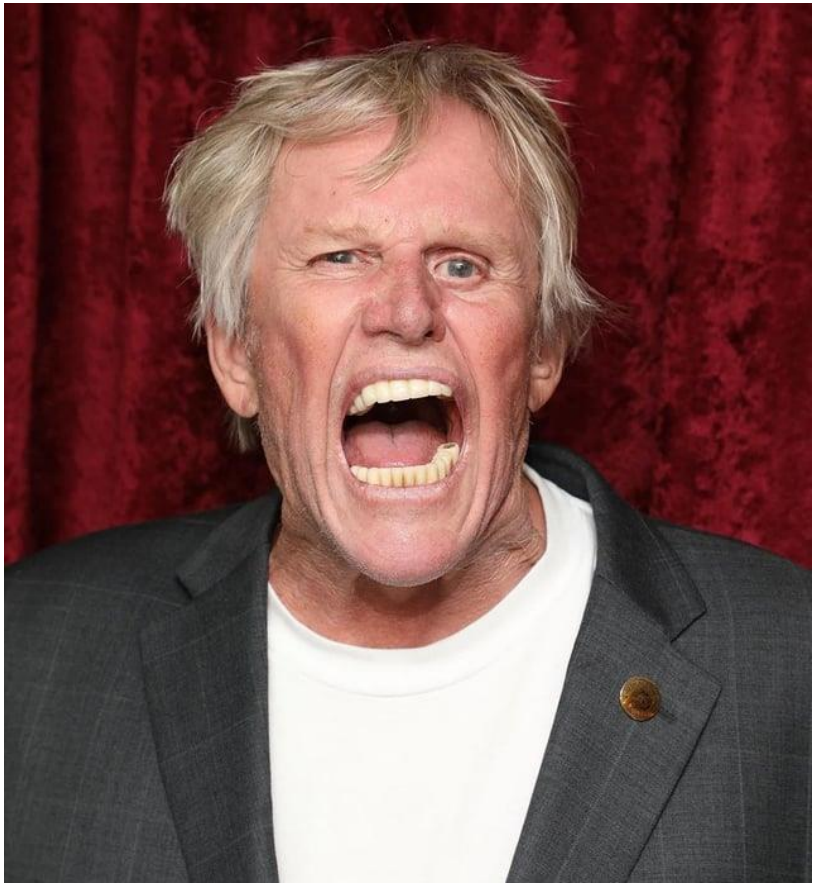

EXERCISE 1

RESEARCH

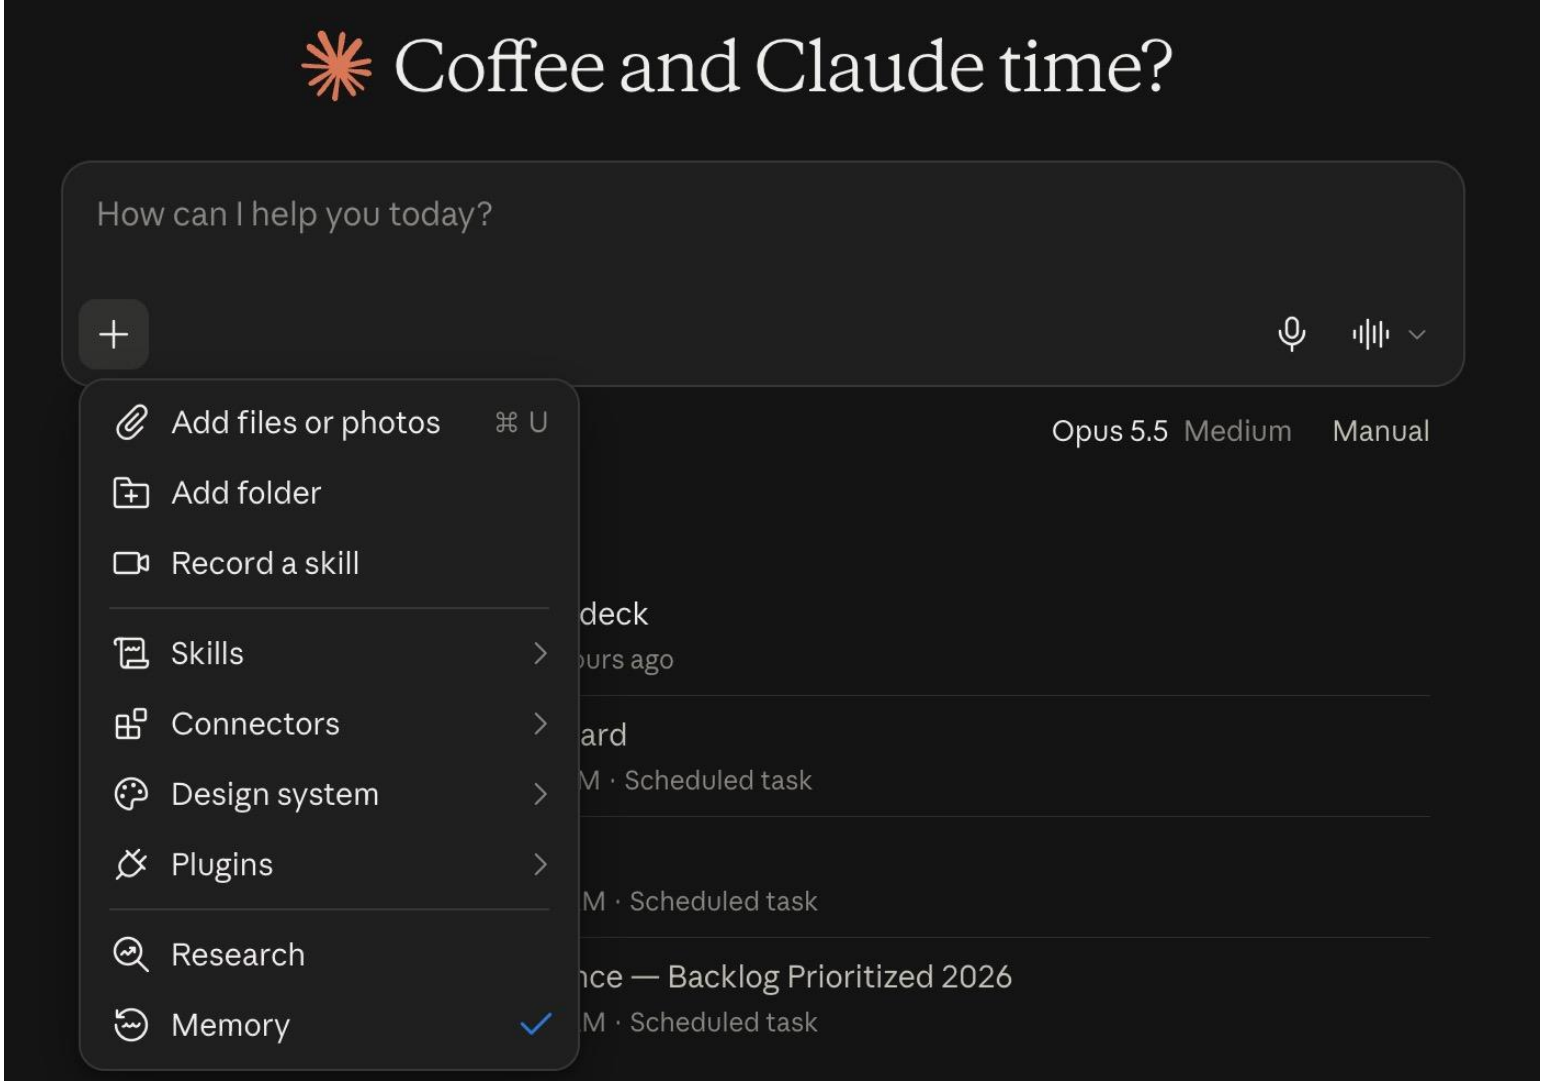

RESEARCH: WHAT IT'S FOR

WORKS ON: web · desktop · mobile · Research mode is optional

- Deep research runs for several minutes, reads dozens of sources, and comes back with a cited brief. It is not a chat reply
- Reach for it when you don't know the answer yet and guessing would be expensive
- This is the cheapest way to find out whether a question is worth pursuing before you build anything around it
- It also needs the least setup, which is why it goes first

It takes a few minutes to run. Launch it, then leave it. We move on while it works and come back to read it.

THE CASINO PROMPT FRAMEWORK

A Trust Insights framework. Six things a prompt has to tell Claude.

	What goes in it
C. Context	What are we looking into, and what background does Claude need?
A. Audience	Who reads this and acts on it?
S. Scope	Time frame, sources, what's in and what's deliberately out
I. Intent	What decision this has to support
N. Narrator	What expert should Claude be, and what should that expert be skeptical about?
O. Outcome	The exact shape the answer should take

Your 5P Framework by Trust Insights™ answers fill four of these six. Purpose becomes Intent, People becomes Audience, Process becomes Scope, Performance becomes Outcome.

TRUST INSIGHTS

YOUR ANSWERS WRITE MOST OF THE PROMPT

Four of the six CASINO lines come straight from your 5P Framework by Trust Insights™ answers.

5P Framework by Trust Insights™	CASINO	In the competitive review
Purpose	Intent	This has to support a decision about where we invest next quarter
People	Audience	Our leadership team, who decide where next quarter's budget goes
Process	Scope	No standard, so Scope writes one: the attached data, plus public sources from the last eighteen months
Performance	Outcome	Three things to do about it, with evidence and inference kept apart
You add this	Context	What I'm assessing, and what's in the attached file
You add this	Narrator	A competitive analyst who's skeptical of marketing claims

No standard process? Then Scope is where you write one. Platform isn't in the prompt at all. It decides where you run it.

TRUST INSIGHTS

CASINO, FILLED IN

The competitive review again, written out as a prompt.

- **Context.** I'm assessing how Trust Insights compares against Deloitte, McKinsey and BCG on generative engine visibility. The attached file has sixteen metrics for all four.
- **Audience.** Our leadership team, who decide where next quarter's budget goes.
- **Scope.** The attached data plus public sources from the last eighteen months. Exclude their own press releases.
- **Intent**. This has to support a decision about where we invest next quarter. I need to know where we lead, where we lag, and which gap to close first.
- **Narrator**. A competitive analyst who is skeptical of marketing claims and says plainly when the evidence is thin.
- **Outcome**. One paragraph per organization, a clearly labeled split between evidence and inference, and three things I should do about it.

Page 9 of your workbook has the framework, and your scenario's prompt is on page 10 or 11. Copy it rather than retyping from the screen.

RESEARCH MODE, OR JUST A GOOD PROMPT?

CASINO is how you ask. Research mode is how hard Claude looks.

TURN IT ON WHEN

- The answer is out on the open web
- It's newer than the model knows. Sonnet stops at January 2026
- You need sources you can cite

SKIP IT WHEN

- The evidence is in the files you attached
- It's your own data
- It's a quick fact

To turn it on, click + at the bottom left of the message box, then Research. Web search has to be on. Of today's five scenarios, only competitive analysis needs it.

TRUST INSIGHTS

LIVE DEMO · EXERCISE 1

START A RESEARCH PROMPT

1. Open your scenario's Exercise 1 prompt in the workbook
2. Copy it, and change anything in [brackets]
3. Attach your scenario's sample file
4. Needs the open web? Click +, then Research. Otherwise, skip it
5. Send it, and leave it running

Check: spot-check three citations. If two don't support the claim, tighten Scope and run it again.

EXERCISE 1: DEEP RESEARCH

LET IT RUN.

It takes a few minutes, sometimes longer. Leave the tab open and don't nudge it. While it works: what happens when a prompt skips Scope and Intent.

RESEARCH IN PRACTICE

THE ASK

- Intent: this has to support a decision about where we invest next quarter
- Narrator: a competitive analyst who is skeptical of marketing claims and says plainly when the evidence is thin
- Outcome: label what's evidenced and what's inference, and cite every claim with a link

WHAT COMES BACK

- Trust Insights ranks 4th of 4 on generative engine visibility. 44.6, a D
- But it leads the entire set on Relevance at 100, an A. The gap is Presence, not content quality
- 5,000 mentions against McKinsey's 120,000. That's a scale problem, and it has a different fix
- Three recommended actions, and an honest note that the maths still needs validating

The split finding is the point. Being told we were behind would have been useless. Being told we're behind on reach and ahead on quality changed what we did next.

TRUST INSIGHTS

WHAT CAME BACK?

Before you build on it, check it.

- Hold it up against what you wrote for "How you'll know" in Exercise 0
- Spot-check three citations. If two don't support the claim, tighten Scope and run it again
- Is the evidence kept apart from the inference?
- What surprised you? That's usually the finding

Still running? Leave it. It'll be ready for Exercise 2.

TRUST INSIGHTS

EXERCISE 2

PROJECT

PROJECT: LOAD YOUR CONTEXT ONCE

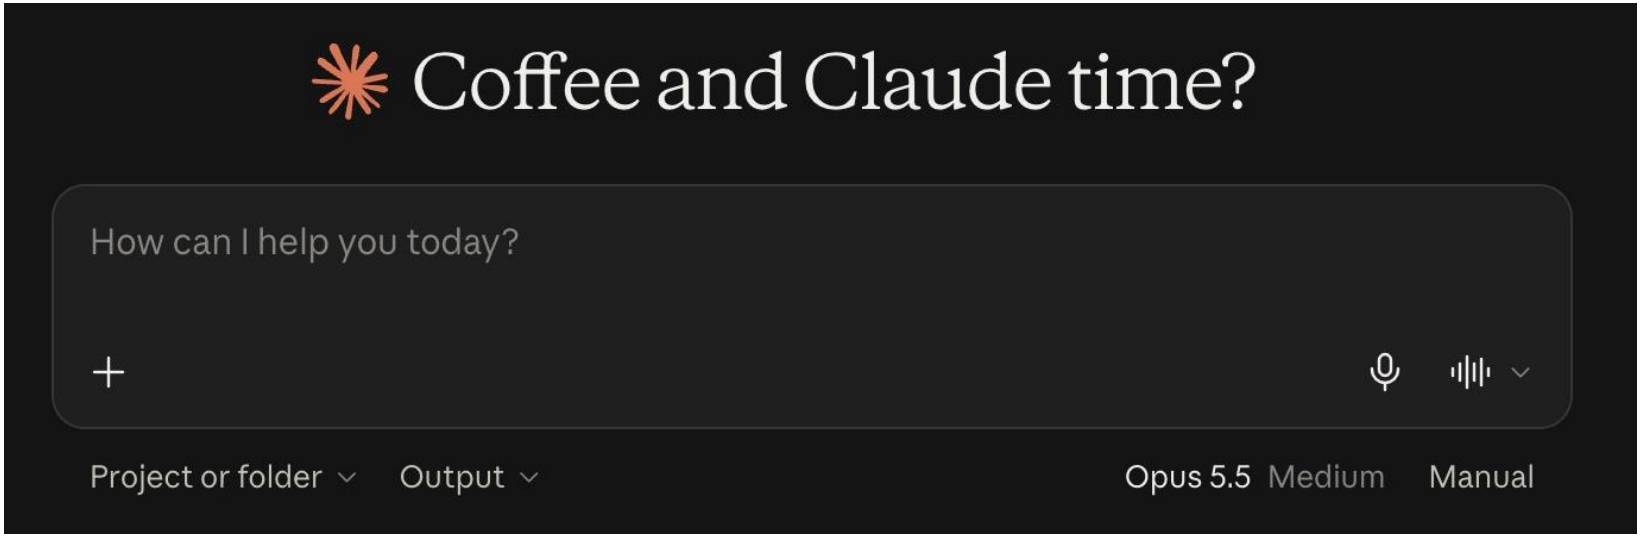

WORKS ON: web · desktop · mobile · pick it from "Project or folder" in the composer

- A Project is a persistent workspace. The files and instructions you put in it are available to every conversation inside it
- The gap between a mediocre output and a good one is almost never the prompt. It's what Claude already knows about you
- Most people open a blank chat and type 'write me a blog post,' giving Claude none of the context a new hire would get on dayone
- What belongs in here is a brand guide, your definitions, your good and bad examples, and how decisions actually get made
- If somebody tells you Claude already knows all this, they're describing memory. Memory makes one person faster and leaves when they do

This is the highest-leverage twenty minutes in the whole workshop, and the one people skip.

TRUST INSIGHTS

Coffee and Claude time?
How can I help you today?
Project or folder
Output
Opus 5.5 Medium
Manual

WHAT GOES INTO A GOOD PROJECT

A Project is only as good as what you put in it. This is the part people rush.

CONTEXT

Your positioning, your definitions, and two past pieces: one good, one weak.

LIVE SOURCES

Connect, don't upload: Slack or Teams channels, email labels, Drive or SharePoint folders.

STANDING INSTRUCTIONS

Who it's for, who's speaking, what good looks like. CASINO's Audience, Narrator and Outcome.

AN OWNER

Somebody who keeps it current and clears out what's stale.

Most disappointing AI output is a missing-context problem wearing a prompt-engineering costume.

TRUST INSIGHTS

WHAT GOES IN, AND WHO CAN SEE IT

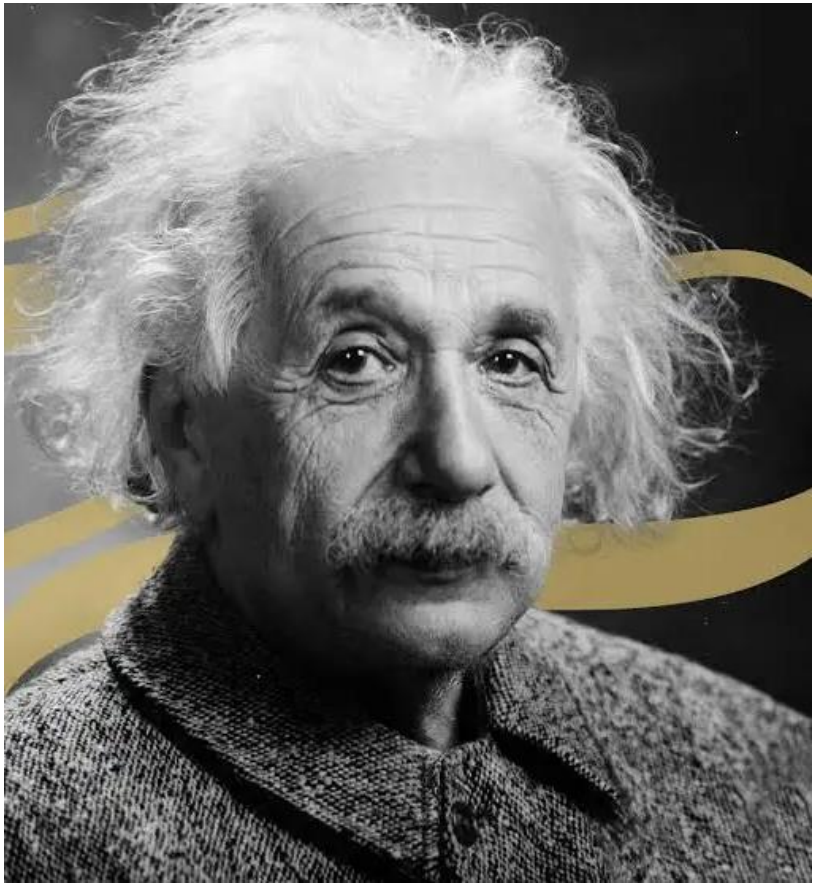

Decide this before you load anything into a Project.

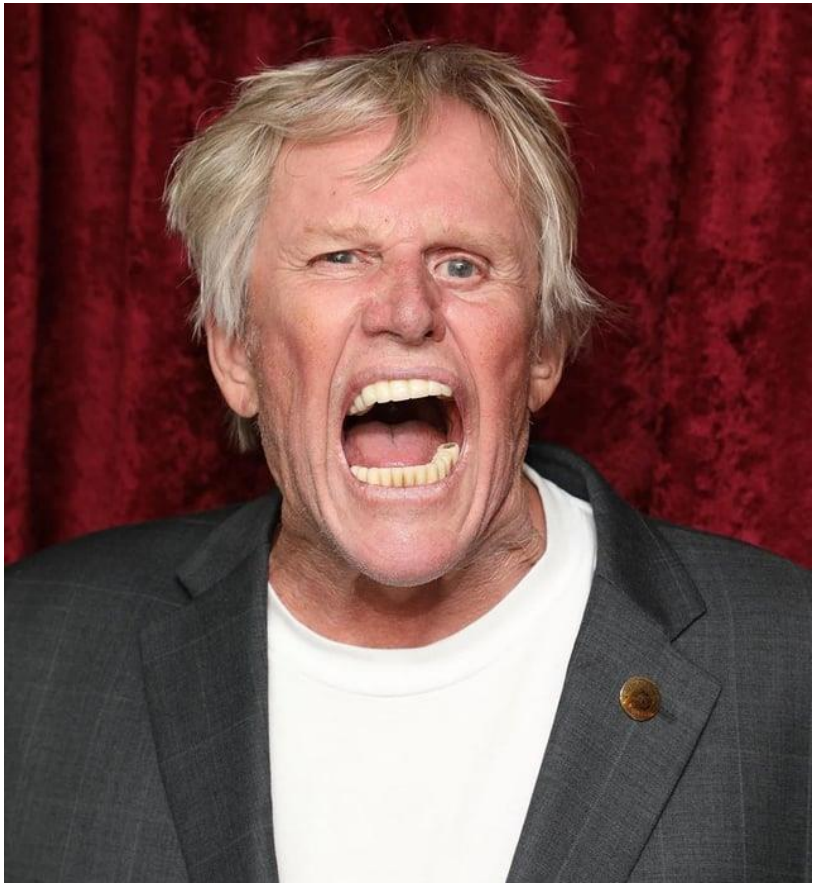

- No personal information. Not customers, not employees. That's the rule I never break
- On Team and Enterprise, your conversations aren't used to train models. On Free, Pro and Max, you choose: Settings, then Privacy, then "Help improve our AI models." Check yours
- Upload to a Project and the file is stored with that Project until you delete it. Point Claude at a local folder and the files stay on your computer, but what Claude reads still goes to the cloud to be processed
- Incognito isn't saved to your history or memory. It's still included in your organization's data exports, and kept for 30 days

Incognito means "not in my history." It doesn't mean "my employer can't see it."

TRUST INSIGHTS

PROJECT IN PRACTICE

THE ASK

- Load: our positioning doc, the three dimensions we compete on and how we define each
- Load: two analyses I thought were good, and one I thought was shallow
- Standing instruction: always separate evidence from inference, name the source, and tell me when you don't have enough to say. Never fill a gap with a plausible guess

WHAT COMES BACK

- The next prompt was one line instead of three paragraphs of throat-clearing
- The output came back using our terminology and our definitions of the three dimensions
- When the data was thin on YouTube volume, it said so instead of estimating
- A colleague got a comparable result from a shorter prompt, which is the real test

That standing instruction is the one that matters. Competitive work is where confident invention does the most damage.

LIVE DEMO · EXERCISE 2

BUILD A PROJECT

1. Create a Project named for your scenario
2. Add your sample file and what came back from Exercise 1
3. Paste the Project instructions from your workbook
4. Show where live sources would connect: Slack or Teams channels, email labels, Drive or SharePoint folders
5. Test it with one short question, like "Where are we strongest?"

Check: if the answer comes back in your terms without you explaining them, the Project is working.

EXERCISE 2: BUILD A PROJECT

BUILD A PROJECT AND LOAD IT WITH YOUR CONTEXT.

Use real material if you can. Use your scenario's sample file if you'd rather not put company documents in front of the room. Either way, you'll feel the difference on the very next prompt.

BREAK

TAKE A BREAK.

Ten minutes. Leave everything open. Whatever's running will still be there when you get back.

EXERCISE 3

ARTIFACT

ARTIFACT: MAKE THE OUTPUT A THING

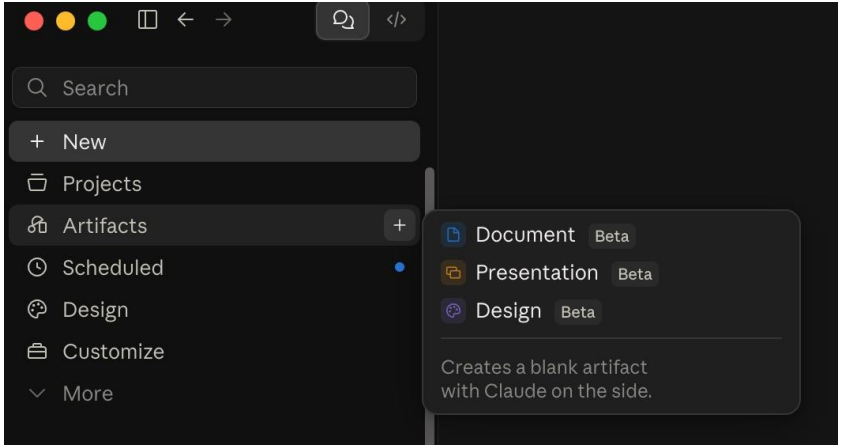

WORKS ON: web · desktop · open them on mobile · pick docs or slides from Output

- An artifact is a real output you can open, use and send. A document, a dashboard, a calculator, an interactive page
- Ask for a tracker, a one-page summary your board can open, or a chart that updates when the numbers change
- Documents, presentations and designs now live in Artifacts. Start one from the Artifacts page or pick it from Output in the composer. All three are in beta
- This is the exercise that surprises people most, because it doesn't require knowing how to build any of it

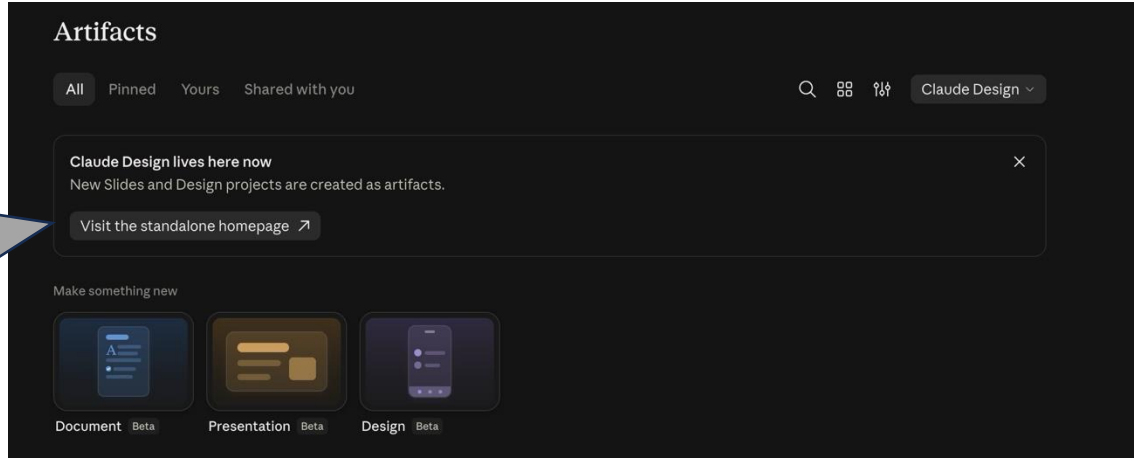

Artifacts are for collaborating now. Share one by link, let your colleagues comment, and hand those comments straight back to Claude to fix.

TRUST INSIGHTS

THIS IS WHERE DESIGN LIVES NOW

WHY AN ARTIFACT AND NOT LOOKER STUDIO?

Both are dashboards. They're for different jobs.

	Reach for it when
Looker Studio, Power BI, Tableau	Lots of people need the same view for a long time, it has to connect live to governed data, and someone owns it
An artifact	You have a question this week, the data lives in three places no BI tool connects, and you don't want to wait in a build queue

The artifact is often how you find out what the real dashboard should be.

If your tier won't give you the report, connect it and build it yourself.

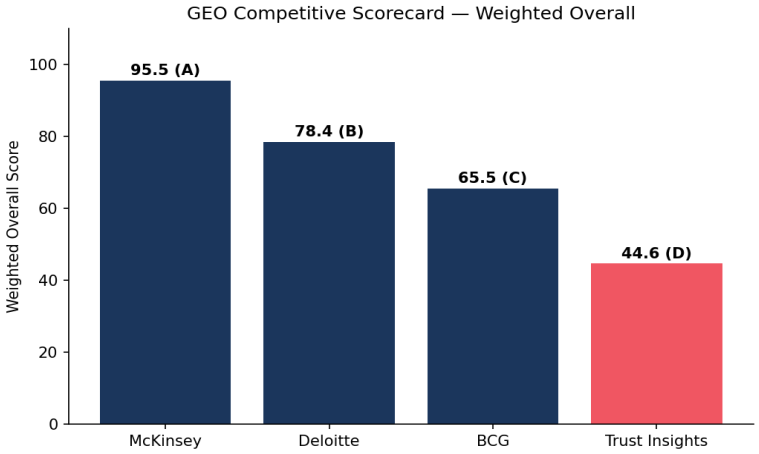

TRUST INSIGHTS

ARTIFACT IN PRACTICE

THE ASK

- Build the competitive scorecard as an interactive page, one row per organization and one column per dimension
- Score each dimension from 0 to 100 and show the sub-metrics that produced each score
- Show me the calculation, not just the result. I need to be able to defend these numbers

WHAT COMES BACK

TRUST INSIGHTS

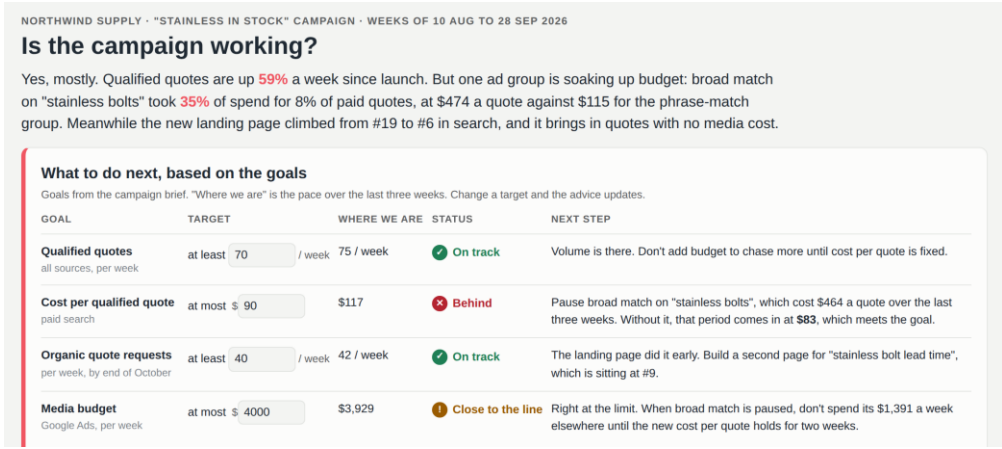

A SECOND ARTIFACT: THE CAMPAIGN TRACKER

Four exports that don't agree, turned into one page and a recommendation. All synthetic.

THE ASK

- Context: eight weeks of Google Ads, web analytics, CRM and Search Console exports
- Audience: a CMO deciding next month's budget, who doesn't trust any one tool
- Scope: where the tools disagree, show both numbers
- Outcome: what to do next against four goals, with the targets editable

WHAT COMES BACK

NORTHWIND SUPPLY · "STAINLESS IN STOCK" CAMPAIGN · WEEKS OF 10 AUG TO 28 SEP 2026

Is the campaign working?

Yes, mostly. Qualified quotes are up 59% a week since launch. But one ad group is soaking up budget: broad match on "stainless bolts" took 35% of spend for 8% of paid quotes, at $474 a quote against $115 for the phrase-match group. Meanwhile the new landing page climbed from #19 to #6 in search, and it brings in quotes with no media cost.

What to do next, based on the goals

Goals from the campaign brief. "Where we are" is the pace over the last three weeks. Change a target and the advice updates.

GOAL	TARGET	WHERE WE ARE	STATUS	NEXT STEP
Qualified quotes all sources, per week	at least 70 / week	75 / week	On track	Volume is there. Don't add budget to chase more until cost per quote is fixed.
Cost per qualified quote paid search	at most $ 90	$117	Behind	Pause broad match on "stainless bolts", which cost $464 a quote over the last three weeks. Without it, that period comes in at **$83**, which meets the goal.
Organic quote requests per week, by end of October	at least 40 / week	42 / week	On track	The landing page did it early. Build a second page for "stainless bolt lead time", which is sitting at #9.
Media budget Google Ads, per week	at most $ 4000	$3,929	Close to the line	Right at the limit. When broad match is paused, don't spend its $1,391 a week elsewhere until the new cost per quote holds for two weeks.

Google Ads claims 574 conversions. The CRM shows 191 qualified quotes. Which number goes to your CEO?

TRUST INSIGHTS

LIVE DEMO · EXERCISE 3

TURN IT INTO AN ARTIFACT

1. Stay in the same Project
2. Want a document, presentation or design? Pick it from Output. For an interactive page, just ask for one
3. Paste your Exercise 3 prompt. Ask for a thing someone can open, not an answer
4. Open it, change one number, and check it moves the way you'd expect
5. Share it by link

Then open the campaign tracker: change a target, and watch the advice change with it.

EXERCISE 3: BUILD AN ARTIFACT

SHOW YOUR NEIGHBOR.

Open what you built and have them change one thing. If it breaks, that's useful to know now.

EXERCISE 4

SKILL

SKILL: ENCODE THE PROCESS ONCE

WORKS ON: web · desktop · mobile uses them · build them on a laptop

- A Skill is an instruction set Claude loads automatically when the situation calls for it, so you stop rewriting the same prompt
- The signal that something should be a Skill is a high TRIPS score, especially on Repetitiveness and Time
- Skills capture judgment rather than just steps. The format, the quality bar, and the things that always go wrong
- A Project is the kitchen. A Skill is the recipe. A Plugin, next, is the cookbook you give away
- Skills can ask you questions first. Ours asks whether it's a standard contract or an RFP, then runs research before it drafts anything

Building one takes about five minutes once you know what you want. Knowing what you want is the hard part, which is why Exercise 2 came first.

TRUST INSIGHTS

SKILL IN PRACTICE

THE ASK

- Turn the process we just went through into a reusable Skill
- Capture the dimensions, how sub-metrics roll up into a dimension score, and how scores become letter grades
- It should work on a different set of competitors without me re-explaining any of this

WHAT COMES BACK

- name: geo-competitive-scorecard
- description: Score a competitive set of two to six brands across Presence, Appearance and Relevance using the normalize-to-leader method
- Then the method itself, in plain English. Confirm the set, collect sub-metrics, normalize to the leader, roll up, weight, grade

LIVE DEMO · EXERCISE 4

ENCODE IT AS A SKILL

1. Still in the Project, paste your Exercise 4 prompt
2. Read the Skill's description. Does it say when to use it?
3. Test it on something it hasn't seen, like a different set of competitors
4. Fix whatever it got wrong, then test it again

Check: if it only works on the original, you encoded an instance, not a method.

EXERCISE 4: BUILD A SKILL

TURN WHAT YOU JUST DID INTO A SKILL.

Take the thing you built in Exercise 2 or 3 and ask Claude to encode it. The format, the steps, the standards you'd apply. Then test it on something slightly different and watch it hold.

EXERCISE 5

PLUGIN

PLUGIN: PACKAGE IT FOR THE TEAM

WORKS ON: web and mobile with cloud connectors · desktop for local ones

- A Plugin bundles Skills, and the connectors they need, into a single thing your colleagues can install
- This is the step that turns 'she's good at AI' into 'our team is good at AI,' and it's the one that gets noticed
- It also solves the bus problem. A Skill on your laptop leaves with you. A Plugin in the team's hands doesn't
- On Enterprise plans, uploaded Skills and Plugins are now scanned automatically for malicious content
- Keep your Skills standalone, as well. Not every job needs the whole Plugin running and using up tokens

Check what your organization allows before you promise your team anything. Nearly a third of this room is at an enterprise with real install policies.

TRUST INSIGHTS

PLUGIN IN PRACTICE

THE ASK

- Package the Skill as a Plugin our team can install
- Write a one-line description that says when to reach for it, rather than what it does
- Add a short note on what it does badly, so nobody over-trusts it

WHAT COMES BACK

- name: geo-competitive-scorecard-plugin
- description: Score a competitive set across Presence, Appearance and Relevance, with weighted overall, letter grade, ranking and gap analysis
- keywords: competitive analysis, GEO, scorecard
- Plus the Skill it bundles and the connector it needs to pull current data

LIVE DEMO · EXERCISE 5

PACKAGE IT AS A PLUGIN

1. Once the Skill has worked twice, paste your Exercise 5 prompt
2. Rewrite the one-line description so it says when to reach for it, not what it does
3. Add a short note on what it does badly, so nobody over-trusts it
4. Hand it to a colleague with no explanation

Check: if they have to ask you anything, rewrite the description.

EXERCISE 5: BUILD A PLUGIN

PACKAGE YOUR SKILL AS A PLUGIN.

Bundle what you built, name it something a colleague would recognize, and write the one-line description that tells them when to reach for it. That description is the whole difference between a Plugin people use and one they ignore.

BEFORE YOU HAND IT OUT

Once other people rely on it, it needs the same governance as any other tool your team depends on.

WHEN IT MANAGES IT

Your admins may roll a Plugin out to everyone, and push changes to it without asking you. Know what changed, and when, before your team finds out the hard way.

WHEN YOU MANAGE IT

You built it and shared it, so you update it, fix it and retire it. If you move on, somebody has to inherit it.

EITHER WAY, KEEP A RECORD

What it is	Who owns it	Who uses it	Built from	What it touches	Last checked
Competitive scorecard	Katie	Marketing team	Our own Skill	A Drive folder	30 Sept 2026

Anything built on an out-of-the-box Plugin carries examples and processes that aren't yours. Check them before it goes out.

TRUST INSIGHTS

PROJECT, ARTIFACT, SKILL OR PLUGIN?

A quick reference

	What it is	Reach for it when
Project	A workspace that holds your context	An ongoing body of work needs the same background every time
Artifact	A finished output you can open, use and send	Somebody has to use the result without you in the room
Skill	Your process, encoded once	You do the same kind of task repeatedly and want it done the same way
Plugin	Skills, and the connectors they need, packaged to hand out	Other people need to run it, not just you

A Project is the kitchen. An artifact is the meal you serve. A Skill is the recipe. A Plugin is the cookbook you give away.

TRUST INSIGHTS

EXERCISE 6

SCHEDULED TASK

SCHEDULED TASK: RUN IT WITHOUT YOU

WORKS ON: web · desktop (keep it open for local tasks) · check them in the Scheduled tab on mobile

- Point Claude at a Skill you've built and tell it when to run. It executes and hands you the result
- This is what agentic actually means at this level. It starts without you, and it brings you the answer
- Cloud tasks run whether or not your laptop is open. Local tasks need your machine awake. Choose deliberately
- I once left a batch of tasks running on my heaviest model, all firing on the first of the month, and showed up Monday with no usage left for the week **<- don't do this**

The temptation is to schedule everything daily. Almost nothing needs to be daily, and nobody reads the other twenty-nine.

TRUST INSIGHTS

SCHEDULED TASK IN PRACTICE

THE ASK

- Rerun the scorecard quarterly on the same four organizations
- Send me the delta summary first and the full scorecard underneath
- Flag anything that moved more than 10 points, and tell me if a source went stale

WHAT COMES BACK

- Q1 to Q2: Presence 4.3 to 11.8. Overall 44.6 to 49.2, still a D, but moving
- Flagged: podcast and blog mentions went 150 to 640. That's the lever working
- Appearance and Relevance essentially unchanged, as expected
- Source check: all four organizations re-pulled clean, no stale inputs

LIVE DEMO · EXERCISE 6

SCHEDULE IT

1. Create a scheduled task and set its model to Sonnet
2. Paste your Exercise 6 prompt as its instructions
3. Pick a cadence that matches how often the answer changes
4. Cloud or local? Local tasks need the desktop app open

Want it auditable? Ask Code for the script instead.

EXERCISE 6: SCHEDULE YOUR JOB

SCHEDULE IT, OR GENERATE THE SCRIPT.

Take the Skill from Exercise 4 and set it to run on a realistic cadence. Pick cloud or local deliberately. If you'd rather see the auditable version, generate the script in Code instead.

CLAUDE CODE

The part of the description that says lightweight team tools

THREE HUNDRED POSTS, ONE STANDARD

Everybody here will tell you GEO matters. Nobody tells you how to fix three hundred pages.

- You have years of content written for a search engine that's being replaced. The repair is structural. Question-first headings, a self-contained answer near the top, claims that survive being quoted out of context, your company named instead of 'we,' and consistent schema
- None of that is creative work. It's the same handful of edits, three hundred times, and the person doing it by hand has quietly drifted by post sixty
- One prompt, the whole directory, and a diff you read before you accept it. That last part is the reason this is Code rather than a chat window
- It isn't a one-time fix either. It's a standard, which makes it a Skill, and makes the quarterly re-check a scheduled task

This is bulk-editing live, ranking content, so it's also how you get confidently wrong at scale. Do twenty, measure, then widen.

TRUST INSIGHTS

WHAT ELSE IT'S GOOD FOR

The job	Why Code
Pull data from a system with no connector	A script you can rerun next month, not a one-time export
Apps Script for the sheet you rebuild monthly	It lives in the sheet your team already opens
A VBA macro for the workbook finance won't leave	Same idea, and finance is never moving off it
Reconcile two exports that should match	It checks every row and shows which ones disagree
Rename or convert a folder of files	Four hundred files, one pass, a list of what changed
Pull course data from our LMS, which has an API and no connector	A script you run whenever you want the numbers
Fix the logo on fourteen versions of the same analysis	One pass, and you see every change before you accept it

None of these are software projects. They're the jobs that are too small to staff and too repetitive to keep doing by hand.

APPS SCRIPT IN PRACTICE

You don't need to read the code. You need to know what to ask for, and what to check.

THE ASK

- Here's the Google Sheet I rebuild on the first of every month, and the six steps I do to it
- Write me an Apps Script that does steps two through six automatically
- Explain each part in plain English, and tell me what would break it

WHAT COMES BACK

- A script, with a comment above each section saying what that section does
- Instructions for where it goes. Extensions, then Apps Script, then Run
- A list of what breaks it: a renamed tab, a new column, an empty row in the middle
- An offer to add a menu button, so nobody has to open the script again

ANSWER, DELIVERABLE, OR CHANGE?

One question sorts the three. It keeps working after the names change.

You want...	Reach for	Because
An answer	Claude	It's a question, not a project
A deliverable	Claude	Something you can open, use and send. Pick the format from Output
A change across many files	Code	You need to see what changed before you accept it

Stay in Claude if you want something to look at or send, if a non-technical colleague has to run it too, or if the source of truth is HubSpot or Drive rather than files.

The people who get the most out of Code usually aren't your engineers. They're the ops and analytics people already living in exports and CSVs.

TRUST INSIGHTS

BACK TO WHAT YOU BUILT

That was the detour. Here is what the last three hours add up to

THE FRAMEWORKS YOU USED TODAY

Four Trust Insights frameworks, each answering a different question.

Ask this	Use
Is this task worth handing to AI at all?	TRIPS
What are the requirements?	5P Framework by Trust Insights™
How do I write the prompt?	CASINO
Where does this work sit, and what moved it?	Five Stages of AI Maturity

TRIPS decides whether. The 5P Framework by Trust Insights™ gathers the requirements. CASINO writes them down as a prompt. The Five Stages tell you what you just moved.

TRUST INSIGHTS

WHERE EACH EXERCISE LIVES

The map you didn't need up front, now that you have somewhere to hang it.

What you built	Claude	Code	Mobile
Research	Yes	Limited	Yes
Project	Yes	Its own kind, beta	Yes
Artifact	Yes	Team/Enterprise	Artifacts tab
Skill	Yes	Yes	Yes
Plugin	Yes	Yes	Cloud connectors
Scheduled task	Yes	Yes	Scheduled tab

As of 30 September 2026. The workbook's "What works where" page has the full version, including web without the desktop app.

TRUST INSIGHTS

WHAT YOU CAN DO NOW

We started with the question everyone is asking: how do you measure the ROI of AI? Go look at the task you wrote down.
This is how you answer it.

- You scored a task on TRIPS and answered the five questions on it, this is how you prioritize.
- You wrote a prompt on CASINO and watched what a thin Intent line produces, so you know which line to tighten next time.
- You saw what each exercise looks like when it goes right and when it goes sideways, which is the part you can't get from a demo.
- You will now approach using AI more strategically, which saves usage, increases adoption, and generates higher quality.

If what you wrote down at the start isn't finished, it's one exercise and one afternoon away. You have the prompt and you know what good looks like.

TRUST INSIGHTS

WHERE YOU GO FROM HERE

Back to the Five Stages. Not Stage 5, just the next one, on your highest TRIPS score.

If today you...	Your next move	Moves you to
Mostly use AI to draft and summarize	Build the Project. Load your context once	Stage 2
Already have your context loaded	Turn your most-repeated task into a Skill	Stage 2 to 3
Have Skills you use yourself	Package one as a Plugin, get a second person on it	Across the team
Have your team on Plugins	Schedule it, measure what changed, report that number	Stage 3 to 4

One exercise, on one task, is a realistic month. Trying to do all six is how this stalls in week two.

TRUST INSIGHTS

WHAT YOU'RE TAKING HOME

The workbook

Every prompt from today, copy and paste ready, plus what to do when each one goes sideways

The sample material

Five scenarios with data, and a prompt for every exercise, so you can run the rest on your own time

The interactive map

The ecosystem, what each surface is for, and a 5P Framework by Trust Insights™ gut-check. Clickable, and it works offline

The delegation notes

What to ask your team for, exercise by exercise, if somebody else is doing the building

Every one of these still works after the next model release. Don't panic when you see "new model!"
