THE WORKBOOK

Six things you can build in Claude, the judgment to know which one you need, and space to write down what you actually built.

Katie Robbert, CEO · Trust Insights

Claude for Business | MAICON 2026 | 3-hour workshop

TRUST INSIGHTS

What you'll walk out able to do

Three things. Say them back to whoever approved your ticket and they'll understand exactly what they bought.

DECIDE

- Look at any task on your plate and say whether it's worth handing to AI at all
- Say which of the six things it needs, and what good looks like when it comes back

ASK

- Write the prompt that gets usable work the first time
- Because you know what a prompt has to contain — not because you memorized one of mine

INSPECT

- Brief someone else to build it, and recognize when what comes back is wrong
- If you manage people who use AI, that is the job

Plus one thing running on your own work. One, not six. You will not get through all six exercises in three hours, and that is the design, not a failure. Each exercise stands alone or works together. Everything you don't reach is in this workbook with the prompt, a worked example and what to do when it goes sideways, ready for a quieter afternoon.

BEFORE YOU START

- A paid Claude plan: Pro, Max, Team or Enterprise
- The model set to Sonnet. It's set per conversation, so check it each time you start a new one
- Incognito off (the ghost icon). Incognito can't create files or run code, and it isn't available in Projects, so Exercises 2 to 6 won't work with it on. More at support.claude.com/en/articles/12260368-use-incognito-chats
- The workbook and the sample pack downloaded, and on your desktop so they're easy to find

What this is not. It isn't a tour of features, and it isn't three hours of watching me use my own account. Every exercise is something you do, on work you actually have, with a prompt already written for you.

How to use this

This is the core book. Each exercise has its prompts inside it, one for each of the five scenarios. The sample files are in the sample pack.

The deal

Not a transcript of the slides, and not a prompt dump. This is the part that survives the workshop: how to decide what to build, what good looks like, what to do when it goes sideways, and a record of what you made. Write in it — the blanks are the point.

What's in here

Section	What it's for	When
Exercise 0: Before you build anything	Your use case, scored on TRIPS, with the five questions answered. The work you do before you open AI	First half hour
The six exercises	One section each: should you, what good looks like, the prompt for your scenario, what to ask for	During each exercise
What not to do	The expensive mistakes, including mine	Read on the plane home
Reference	What works where, troubleshooting, vocabulary	When somebody asks you
Where next	One exercise, one task, one month	Last ten minutes

A note on the exercises

Each exercise stands alone or works together. The prompts build on each other, so if you skip ahead, pick up from the Example Outputs in the sample pack.

The frameworks in here

Framework	Answers	Where
TRIPS	Is this task worth handing to AI at all?	Page 5
5P Framework by Trust Insights™	What are the requirements?	Page 6
CASINO	How do I write the prompt?	Exercise 1
Five Stages of AI Maturity	Where does this work sit, and what's next?	Near the back

If you're not the one building this. Plenty of people in this room will hand the work to somebody else. Every exercise has a *What to ask for* box. Those are the delegation notes: the version you hand over, and for a lot of you it's the most useful page in the section.

EXERCISE 0 · BEFORE YOU BUILD ANYTHING

Your use case

Everything you build today runs on this. Pick something you actually repeat — not something impressive.

The one thing I want to walk out able to do

Why it matters — what's the cost of it staying the way it is?

How I'll know it worked

Pick your scenario

Tick one. Every scenario has sample data and a ready prompt for every exercise. If you'd rather not use real company material, use your scenario's sample data. It's in the sample pack, under Sample Data.

- ☐ **Competitive analysis**
  Who else is out there, and how you actually compare
- ☐ **Content and editorial**
  Blog, newsletter, repurposing, and keeping it on brand
- ☐ **Reporting and performance**
  Turning numbers into the story a leader will read
- ☐ **Process and documentation**
  SOPs, onboarding, how-we-do-it knowledge
- ☐ **Meetings to actions**
  Transcripts and notes into owned follow-ups

Nothing fits? Use the closest scenario and substitute your own subject. The structure transfers; the topic doesn't have to.

EXERCISE 0 · BEFORE YOU BUILD ANYTHING

Is it worth it? Score it with TRIPS

The 5P Framework by Trust Insights™ tells you *what to build*. TRIPS tells you *whether to bother at all*.

TRUST INSIGHTS FRAMEWORK

Score each candidate task 1 to 5 on all five dimensions, then average. Low scores are not a failure — they're a task you should leave alone and spend your afternoon on something else.

	Dimension	The question	Task 1 2 3
T	**Time**	How much of your week does this eat? More time spent means more to win back.	☐ ☐ ☐
R	**Repetitiveness**	How often does it recur in the same shape? Repetition is what makes a process encodable.	☐ ☐ ☐
I	**Importance**	How much does it matter if it's done badly? Low importance means low reward for fixing it.	☐ ☐ ☐
P	**Pain**	How much do you dread it? Pain is a real signal. Dreaded work gets delayed and done poorly.	☐ ☐ ☐
S	**Sufficient data**	Do you have the material Claude would need? Without it, nothing else matters.	☐ ☐ ☐
	Average	Total ÷ 5	☐ ☐ ☐

Reading your scores

If you scored	What it means
4 or above	Build it. This is the task you came here for.
3 to 4	Worth doing, but not first. Park it and come back.
Below 3	Leave it alone. Automating low-value work is how AI projects earn a bad reputation.
Sufficient data scored 1 or 2	Stop. Nothing else matters if Claude has nothing to work from — that's your Exercise 2 project.

The most common mistake is automating the task that's easiest to automate rather than the one that's costing you. High Pain and high Time with low Importance is a real answer too — it means fix it, just don't expect applause.

EXERCISE 0 · BEFORE YOU BUILD ANYTHING

Five questions before you build

The 5P Framework by Trust Insights™ turns a scored task into requirements. Answer these about the work itself, before you open anything.

Purpose	What decision does this work have to support?	
People	Who reads the output, and who does the building?	
Process	Is there a standard for this, or does it live in somebody's head?	
Platform	Where does the finished thing need to live?	
Performance	How will you know whether it worked?	

Whichever question you can't answer is the one to fix first. That's the entire routing rule.

Your answers write most of the prompt

In Exercise 1, four of these five become lines in your CASINO prompt. You add the other two lines yourself.

5P Framework by Trust Insights™	Becomes, in CASINO
Purpose	Intent: the decision this has to support
People	Audience: who reads it and acts on it
Process	Scope. No standard process? Then Scope is where you write one
Performance	Outcome: the exact shape the answer should take
Platform	Not in the prompt at all. It decides where you run it
You add	Context and Narrator

You don't have to do all six. One exercise, done properly on one real use case, is a realistic month. Trying to do all six is how this stalls in week two.

The prompts in this book

Thirty of them: one for every exercise, in each of the five scenarios. Each exercise has its five right after the explanation. Pick the scenario closest to your own work and follow it all the way through.

How they're built

Every prompt is written on CASINO, the framework in Exercise 1. Same six lines every time, so by Exercise 3 you'll be writing your own without looking. Anything in [square brackets] is yours to change.

Scenario	Sample file	What it is
1. Competitive analysis	01-Competitive-Visibility-Data.csv	Trust Insights against Deloitte, McKinsey and BCG on generative engine visibility. The numbers are real and already public.
2. Content and editorial	02-Content-Brand-Voice-and-Posts.md	Northwind Supply, an invented industrial fastener distributor with a four-sentence voice note and three published posts.
3. Reporting and performance	03-Reporting-Channel-Performance-Data.csv (and 03-Reporting-Answer-Key.md, to check your work afterward)	Five months of Northwind Supply channel performance, April to August 2026. Thirty rows.
4. Process and documentation	04-Process-Onboarding-Notes.md (and 04-Process-Distributor-Accounts.csv, for Exercise 6)	How Northwind Supply onboards a new distributor account, written down once by somebody who has since left.
5. Meetings to actions	05-Meetings-Pipeline-Review-Transcript.md	Northwind Supply's Q3 pipeline review on 14 September 2026. Four people, twenty minutes, five commitments.

Three habits

- **Read the italic line first.** It tells you what to do in Claude before you paste, like attaching a file or opening a Project. The files are in the sample pack, under Sample Data.
- **Copy, don't retype.** Copying from a PDF can break lines. The Word copy of this workbook and *00-All-30-Prompts.md* in the sample pack paste cleanly.
- **Check the result before moving on.** Every prompt ends with how to tell it worked. An error in Exercise 2 is still there in Exercise 6.
- **Swap in your own material whenever you're ready.** Keep the six lines and change the subject. That's the skill you're really leaving with.

Using your own work instead? Start from the scenario closest to yours and rewrite Context and Audience first. Those two lines do most of the tailoring.

EXERCISE 1

Research

Start from evidence

WORKS ON **WEB** Yes **DESKTOP** Yes **MOBILE** Yes

Deep research runs for several minutes, reads dozens of sources and returns a cited brief. It is not a chat reply and should not be judged like one.

DO THIS WHEN

- You don't know the answer yet, and guessing would be expensive
- You're about to make a decision on a hunch
- You need to know whether a question is even worth pursuing

SKIP IT WHEN

- You already know the answer and want it written up
- The facts live inside your own systems, not the open web
- You need it in the next ninety seconds

THE PROMPT — Built on CASINO. The framework is on the next page, and your scenario's prompt follows it, ready to copy. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- A structured brief, not an essay. Sections you asked for, in the order you asked
- Citations you can open, and a clear line between what's settled and what's contested
- At least one thing you didn't think to ask about

WHEN IT GOES SIDEWAYS

What you'll see	What to do
It reads generic and could be about any company	You gave it no context. Come back after Exercise 2 and run it again inside a Project.
Citations don't support the claim	Spot-check three. If two fail, discard the brief, don't repair it. Tighten Scope and rerun.
It answered a different question	Your Intent line was vague. Say what decision this has to support, not what topic it covers.

EXERCISE 1 · RESEARCH

The CASINO prompt framework

TRUST INSIGHTS FRAMEWORK

Six things a prompt has to tell Claude before it's worth the compute. Miss one and you get something fluent, plausible and not quite what you needed.

	Element	What it answers
C	**Context**	What are we looking into, and what background does Claude need to not start from zero?
A	**Audience**	Who reads this and acts on it? A board brief and a working doc are different artifacts.
S	**Scope**	Time frame, sources, what's in and what's deliberately out. Scope is where quality is won.
I	**Intent**	What decision this has to support. The single highest-leverage line in the prompt.
N	**Narrator**	What expert should Claude be, and what should that expert be skeptical about?
O	**Outcome**	The exact shape of the answer. Sections, order, length, and how claims get cited.

Your 5P Framework by Trust Insights™ answers fill four of these six. Purpose becomes Intent, People becomes Audience, Process becomes Scope, Performance becomes Outcome. Page 6 has the mapping.

If you only tighten one line, tighten Intent. "Research our competitors" and "tell me where to spend next quarter's budget" produce completely different work. Vague intent is the single most common reason research comes back interesting and useless.

Draft yours

Intent. What decision does this have to support?

Outcome. What shape should the answer take?

EXERCISE 1 · RESEARCH

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

Switch on Research, attach 01-Competitive-Visibility-Data.csv, and paste this.

Context	I am assessing how Trust Insights compares against Deloitte, McKinsey and BCG on generative engine visibility. The attached file has sixteen sub-metrics across three dimensions (Presence, Appearance and Relevance) for all four organizations.
Audience	Our leadership team, who need to decide where next quarter's budget goes.
Scope	Only the data in the attached file, plus public sources from the last eighteen months. Exclude the companies' own press releases.
Intent	This has to support a decision about where we invest next quarter. I need to know where we genuinely lead, where we genuinely lag, and which gap is worth closing first.
Narrator	Act as a competitive analyst who is skeptical of marketing claims and says plainly when the evidence is thin.
Outcome	One paragraph per organization. A comparison across the three dimensions. A clearly labeled split between what is evidenced and what is inference. Three things I should do about it, in priority order.

How you know it worked: Spot-check three citations. If two don't support the claim, tighten Scope and run it again.

SCENARIO 2 · CONTENT AND EDITORIAL

Attach 02-Content-Brand-Voice-and-Posts.md and paste this. Research doesn't need to be on for this one, because the evidence is in the file.

Context	I am trying to get consistent writing out of Claude for Northwind Supply, an industrial fastener distributor. The attached file has our brand voice note and three published posts.
Audience	Maintenance engineers and procurement managers at mid-market manufacturers. They are technical, short on time, and allergic to marketing language.
Scope	Use only the attached posts as evidence of how we write. Do not invent house rules that are not in the material.
Intent	I need a usable style guide, because the one we have is four sentences long and hasn't been updated since 2021.
Narrator	Act as an editor who has read our published work and can describe what we actually do, as opposed to what we say we do.
Outcome	A style guide covering voice, sentence length, technical depth, terminology we use and avoid, and three worked before-and-after examples. Flag anything you had to guess at.

How you know it worked: Read the flags. Anything it guessed at is a question for your team, not a rule.

SCENARIO 3 · REPORTING AND PERFORMANCE

Attach 03-Reporting-Channel-Performance-Data.csv and paste this. Leave 03-Reporting-Answer-Key.md closed until you've seen the answer.

Context	The attached file has five months of channel performance for Northwind Supply, April through August 2026: sessions, engaged sessions, conversions, revenue and spend, by month and channel.
Audience	Our CEO, who has ten minutes and will ask one question: what do we do about it?
Scope	Only the attached data. Do not speculate about causes you cannot see in it.
Intent	I need to know which single trend in here matters most, and what I am recommending we do before the Q4 budget is set.
Narrator	Act as an analyst who leads with the conclusion and shows the arithmetic underneath it.
Outcome	The finding first, in one paragraph. Then the numbers that support it. Then what you would do about it and what it would cost. Show the paid search efficiency calculation (revenue divided by spend) for every month.

How you know it worked: Now open 03-Reporting-Answer-Key.md. Did it lead with the same thing?

The prompt for your scenario (continued)

SCENARIO 4 · PROCESS AND DOCUMENTATION

Attach 04-Process-Onboarding-Notes.md and paste this.

Context	The attached file is the only documentation we have for how Northwind Supply onboards a new distributor account. It was written by somebody who has left.
Audience	The person who inherits this process next month, and the manager deciding who should own it.
Scope	Work only from the attached notes. Where the notes are ambiguous, say so rather than resolving it for me.
Intent	I need a documented process good enough to hand to a new owner, and an honest list of what's broken in it.
Narrator	Act as an operations lead who has cleaned up processes like this before and knows which gaps cause the expensive failures.
Outcome	The process as a numbered sequence with an owner named for each step. Then a separate list of the failure points you found, ranked by what they would cost us. Then the three questions I need to answer before this can be finalized.

How you know it worked: Count the steps with no owner. That number is the real finding.

SCENARIO 5 · MEETINGS TO ACTIONS

Attach 05-Meetings-Pipeline-Review-Transcript.md and paste this.

Context	The attached file is a transcript of our Q3 pipeline review, 14 September 2026, with four people present.
Audience	The four attendees, who will each get their own items and need no context beyond what was said.
Scope	Only commitments actually made in the transcript. Do not infer tasks that were discussed but not agreed.
Intent	I need every commitment captured with an owner and a date, so that nothing depends on somebody remembering.
Narrator	Act as a chief of staff who is careful about the difference between a decision and a discussion.
Outcome	A table of owner, commitment and due date. Then a short list of things that were raised but deliberately not assigned, so we can see what we chose to leave. Flag any commitment where the date was implied rather than stated.

How you know it worked: Dana's summary at the end lists four items. If your table has more than five, it's turning discussion into tasks.

EXERCISE 1 · RESEARCH

Your notes

Do you need Research mode? CASINO is how you ask. Research mode is how hard Claude looks. Turn it on when the answer is out on the open web, when it's newer than the model knows, or when you need sources you can cite: click + in the message box, then Research, with web search on. Skip it when the evidence is in the files you attached or it's your own data. Of the five scenarios, only competitive analysis needs it.

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
Answer a question worth the compute	Whoever acts on the finding	Evidence kept apart from inference	Claude, with Research on	A decision you can defend

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask for the brief, not the answer
- Ask what they searched and what they deliberately excluded
- Insist on citations you can open. Unverifiable research is worse than none, because it feels like knowledge

What surprised you? What's still unresolved?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Stage 1 to Stage 2. The work still starts with you, but you are no longer starting from nothing.

EXERCISE 2

Project

Stop re-explaining your business

WORKS ON **WEB** Yes **DESKTOP** Yes **MOBILE** Yes

A Project is a persistent workspace. The files and standing instructions you put in it are available to every conversation inside it, so you stop pasting the same background every session. You pick it from "Project or folder" in the composer.

DO THIS WHEN

- You're re-explaining your company every time you open a chat
- Outputs come back competent but generic and off-brand
- More than one person needs Claude working from the same background

SKIP IT WHEN

- It's genuinely a one-off question you'll never ask again
- You don't yet have any documented standards to load. Fix that first
- You only need Claude to remember something about you. That's memory, not a Project

THE PROMPT — Your scenario's prompt is on the pages right after this one, ready to copy. If your Exercise 1 didn't finish, use the stand-in in the sample pack, under Example Outputs, Exercise 1. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- The next output sounds like your organization without you saying so
- You stop opening prompts with three paragraphs of throat-clearing context
- Someone else on your team gets a comparable result from a shorter prompt

WHEN IT GOES SIDEWAYS

What you'll see	What to do
Output still feels generic	You loaded logos and boilerplate rather than judgment. Add good and bad examples, 'like this, not like that' does more than any adjective.
Claude contradicts your actual numbers	Your definitions aren't in there. Add how you calculate the metrics you care about.
It's already stale	Point at a live source. Drive, SharePoint, Box. Instead of uploading copies somebody has to remember to refresh.
Claude already seems to know this, so why bother?	That's memory, and it's yours alone, nobody can inherit it. A Project is the version your team can use and audit.

EXERCISE 2 · PROJECT

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

Create a Project called [GEO competitive]. Add 01-Competitive-Visibility-Data.csv and your Exercise 1 brief. Paste this into the Project instructions.

Context	This Project holds our competitive work on generative engine visibility: Trust Insights against Deloitte, McKinsey and BCG. The data file has sixteen sub-metrics across Presence, Appearance and Relevance. The Exercise 1 brief is our starting read.
Audience	Our leadership team. They decide where next quarter's budget goes, and they will ask how every number was produced.
Scope	Use the files in this Project and any sources I give you. Name anything else you use. If a figure isn't in the data, say so. Never estimate one.
Intent	Every answer in this Project should help decide which visibility gap is worth closing first.
Narrator	A competitive analyst who is skeptical of marketing claims, including ours.
Outcome	Keep evidence and inference in separate, labeled sections. Use the three dimension names exactly as the file does. Tell me when the data is too thin to support a conclusion.

How you know it worked: Ask one short question, like "Where are we strongest?" If the answer comes back in our terms without you explaining them, the Project is working.

SCENARIO 2 · CONTENT AND EDITORIAL

Create a Project called [Northwind voice]. Add 02-Content-Brand-Voice-and-Posts.md and your Exercise 1 style guide. Paste this into the Project instructions.

Context	This Project is how Northwind Supply writes. It holds our brand voice note, three published posts, and the style guide from Exercise 1.
Audience	Maintenance engineers and procurement managers at mid-market manufacturers. Technical, busy, and allergic to marketing language.
Scope	The published posts are the evidence of how we write. The voice note is what we say about ourselves. Where the two disagree, the posts win. Don't invent rules that aren't in this material.
Intent	Anything written in this Project should be publishable with light edits, not rewritten from scratch.
Narrator	Our senior editor, who has read everything we've published.
Outcome	No exclamation points. "Customers," never "clients." Measurements spelled out. Lead with the practical answer. When you're guessing at a rule, say so.

How you know it worked: Ask for a 150-word post on why Northwind tells customers about substitutions. If it sounds like Post C without you pointing at it, the Project is working.

The prompt for your scenario (continued)

SCENARIO 3 · REPORTING AND PERFORMANCE

Create a Project called [Northwind channel reporting]. Add 03-Reporting-Channel-Performance-Data.csv and your Exercise 1 readout. Paste this into the Project instructions.

Context	This Project is Northwind Supply's monthly channel reporting. It holds five months of performance by channel, April to August 2026, and the readout from Exercise 1.
Audience	Our CEO, who has ten minutes, and finance, who will check every number.
Scope	Only the data in this Project. Don't speculate about causes you can't see in it.
Intent	Every answer should end in what we do about it before the Q4 budget is set.
Narrator	An analyst who leads with the conclusion and shows the arithmetic underneath.
Outcome	Use these definitions every time. Paid search efficiency: Paid Search revenue divided by Paid Search spend. Engagement rate: engaged sessions divided by sessions. Conversion rate: conversions divided by sessions. Round money to the nearest thousand. Say when a trend rests on fewer than three months.

How you know it worked: Ask "What's the one number the CEO needs this month?" If it answers with a number and the arithmetic behind it, the Project is working.

SCENARIO 4 · PROCESS AND DOCUMENTATION

Create a Project called [Distributor onboarding]. Add 04-Process-Onboarding-Notes.md and your Exercise 1 process. Paste this into the Project instructions.

Context	This Project is the documentation for how Northwind Supply onboards a new distributor account. It holds the original notes, written by someone who has left, and the documented process from Exercise 1.
Audience	Tom Beckett, who owns this process as of October, and whoever runs it day to day.
Scope	The notes and the documented process. Where they disagree or are unclear, flag it. Don't resolve it for me.
Intent	Anything built here should make this process safe to hand to someone new.
Narrator	An operations lead who has cleaned up processes like this before.
Outcome	Always name an owner for every step, or say there isn't one. Keep the national and regional paths visible rather than blending them. Keep a running list of open questions.

How you know it worked: Ask "Who owns the welcome email?" The right answer is "nobody yet." If the Project invents an owner, tighten Scope.

SCENARIO 5 · MEETINGS TO ACTIONS

Create a Project called [Pipeline reviews]. Add 05-Meetings-Pipeline-Review-Transcript.md and your Exercise 1 table. Paste this into the Project instructions.

Context	This Project holds Northwind Supply's pipeline review meetings, starting with the 14 September 2026 transcript, and the commitments table from Exercise 1.
Audience	The four regular attendees: Dana Whitfield (Sales), Marcus Reyes (Finance), Priya Raman (Marketing) and Tom Beckett (Operations).
Scope	Only what was said in the transcripts. A decision is something agreed. A discussion isn't.
Intent	Nothing agreed in these meetings should depend on someone remembering it.
Narrator	A chief of staff who is careful about the difference between a decision and a discussion.
Outcome	Show commitments as owner, commitment and due date. Flag dates that were implied rather than stated. Keep a running list of things raised but deliberately not assigned.

How you know it worked: Ask "What did Marcus agree to?" It's a subtle one. Marcus agreed to work on Priya's traffic analysis. Reviewing Tom's buffer stock and getting Priya's data first are conditions he set for other people, not tasks he took on.

EXERCISE 2 · PROJECT

Your notes

This is not the same as memory. Claude also picks things up about you as you work. Your role, your preferences, how you like things written. That's memory: automatic, individual to you, and nobody can inherit it. A Project is what you put in on purpose, and it's the version your team can use, review and keep current. Worth checking before you assume: memory is on by default on Free, Pro and Max, and **off by default for Team and Enterprise**. Half a room usually has it without knowing; the other half assumes it and doesn't. Each Project also keeps its own separate memory space, and memory isn't available to organizations under HIPAA or custom data-retention agreements.

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
Stop re-explaining the business	Somebody has to own the context	What goes in, and who refreshes it	Claude, in a Project	Shorter prompts, same quality

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask whether the context layer exists at all before you ask for AI output. Most disappointing results are a missing-context problem wearing a prompt-engineering costume
- Make somebody own it, or it goes stale in a month and quietly poisons everything built on it
- Ask where it points: a Project referencing your live source beats one holding copies
- Don't confuse it with memory. Memory makes one person faster, a Project makes the organization faster

What did you load? What was missing that you had to go find?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Stage 2, properly. Claude is doing real work with your context behind it instead of guessing.

EXERCISE 3

Artifact

Make the output a thing

WORKS ON **WEB** Yes **DESKTOP** Yes **MOBILE** Open them in the Artifacts tab

An artifact is a real output you can open, use and send, a document, a dashboard, a calculator, an interactive page. Rather than text in a conversation you'll lose. Documents, presentations and designs live in Artifacts too. Start one from the Artifacts page, or pick it from Output in the composer, and it exports to Word, PowerPoint, Google Docs or PDF.

DO THIS WHEN

- The answer deserves more than a paragraph
- You'd otherwise hand-build a slide or a spreadsheet
- Someone needs to open it without you in the room

SKIP IT WHEN

- A sentence would genuinely do
- It's a one-time number nobody will look at twice

THE PROMPT — Your scenario's prompt is on the pages right after this one, ready to copy. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- You can send the link or the file and it stands on its own
- Someone changes an input and the output updates
- It replaces something you were previously rebuilding by hand every month

WHEN IT GOES SIDEWAYS

What you'll see	What to do
It looks impressive and says nothing	Ask for the decision it supports, not the visualization. Lead with the number that matters.
It won't open for a colleague	Check where you built it. Artifacts published from Code need Team or Enterprise; Claude doesn't.
It's beautiful but wrong	The data went in unchecked. Artifacts make errors look authoritative. Verify before you send.

EXERCISE 3 · ARTIFACT

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

In the same Project, paste this.

Context	Use the data file and the brief in this Project.
Audience	The leadership team, opening it without me in the room.
Scope	The four organizations and three dimensions in the file. Nothing added.
Intent	They need to see where we stand and which gap to close first, and trust the numbers enough to act on them.
Narrator	A data analyst who shows her working.
Outcome	An interactive scorecard: one row per organization, one column per dimension, each scored 0 to 100 by normalizing to the leader. Click a score to see the sub-metrics behind it. Show the calculation, not just the result. Put the one gap worth closing first at the top, in a single sentence.

How you know it worked: Change one number in the data and check the score moves the way you'd expect.

SCENARIO 2 · CONTENT AND EDITORIAL

In the same Project, set Output to a document, then paste this.

Context	Use the style guide and the three posts in this Project.
Audience	Freelance writers and new hires who have never read a Northwind post.
Scope	Only rules the material supports. Mark anything you inferred.
Intent	Replace the four-sentence voice note with something a writer can actually use.
Narrator	An editor who teaches by example.
Outcome	A one-page style guide: voice, sentence length, technical depth, words we use and avoid, and three before-and-after examples built from real sentences in the posts. It has to export to Word, because that's where the writers work.

How you know it worked: Export it and open it. If it only works inside Claude, it isn't finished.

SCENARIO 3 · REPORTING AND PERFORMANCE

In the same Project, paste this.

Context	The data and definitions in this Project.
Audience	The CEO, opening it on her own before the budget meeting.
Scope	April to August 2026, all six channels.
Intent	She needs to see, in under a minute, that we're paying for revenue we used to get for free.
Narrator	An analyst who builds for executives.
Outcome	An interactive dashboard. The finding in one sentence at the top. Sessions and revenue by channel over time. Paid search efficiency as its own chart, with the calculation visible, so finance can check it. A filter by channel.

How you know it worked: Filter to Paid Search and check August's efficiency against your own arithmetic. It should be about 2.1.

The prompt for your scenario (continued)

SCENARIO 4 · PROCESS AND DOCUMENTATION

In the same Project, paste this.

Context	The documented process in this Project.
Audience	Whoever sets up the next account, working through it step by step.
Scope	The process as documented. Mark any step where the owner is still undecided.
Intent	No account gets stuck at the tax certificate again, and no first order goes unnoticed.
Narrator	An operations lead building a tool, not a document.
Outcome	An interactive onboarding checklist. One row per step, with owner, typical time and a checkbox. The ERP setup step can't be ticked until the tax exemption certificate is. A day counter from ERP setup that turns red at 14 days with no first order. A toggle between the national and regional paths.

How you know it worked: Try to tick ERP setup before the tax certificate. If it lets you, it isn't finished.

SCENARIO 5 · MEETINGS TO ACTIONS

In the same Project, paste this.

Context	The commitments table in this Project.
Audience	The four attendees, each checking their own items.
Scope	Commitments from the 14 September meeting.
Intent	Everyone can see what they owe and when, without a follow-up email thread.
Narrator	A chief of staff building a tracker.
Outcome	An interactive tracker: owner, commitment, due date, status, and whether the date was stated or implied. Filter by owner. Sort by due date. Overdue items in red. A second section for things raised but not assigned.

How you know it worked: Filter to Tom. He should have two items, and the shipping model is due first.

EXERCISE 3 · ARTIFACT

Your notes

Documents, presentations and designs live in Artifacts now. Claude makes a real, editable file you can share by link and export to Word, PowerPoint, Google Docs or PDF. Colleagues can comment, and you can hand the comments back to Claude. All three are in beta on paid plans, and Enterprise admins decide when they switch on, so check before you build a client deliverable on them.

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
Something a colleague can open	The person who is not in the room	Show the calculation, not just the result	Claude	It replaces a manual rebuild

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Stop accepting screenshots and pasted text as deliverables. Ask for the thing itself
- Ask 'could this be interactive?' more often; a lot of recurring slide requests are a dashboard nobody thought to ask for
- Good test of whether it was worth it: would you have paid a contractor for this?
- Ask what format it has to land in. A deck that exports to PowerPoint gets used; a clever page nobody can put in the board pack doesn't

What did you build? Who would you send it to?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Still Stage 2, but the output is finally usable by somebody else. The jump comes next.

EXERCISE 4

Skill

Encode the process once

WORKS ON **WEB** Yes **DESKTOP** Yes **MOBILE** Uses them; build on a laptop

A Skill is an instruction set Claude loads automatically when the situation calls for it. It captures your process and your quality bar, so you stop rewriting the same prompt.

DO THIS WHEN

- High on TRIPS. Especially Repetitiveness and Time
- You've explained the same thing three times
- The quality bar lives in one person's head

SKIP IT WHEN

- The task changes shape every time you do it
- You've only done it once. You don't know the process yet
- You're trying to encode something you've never done manually

THE PROMPT — Your scenario's prompt is on the pages right after this one, ready to copy. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- You run it on a slightly different input and it still holds
- A colleague uses it and gets something you'd have signed off on
- You can read the Skill itself and recognize your own standards in plain language

WHEN IT GOES SIDEWAYS

What you'll see	What to do
It works on your example and nothing else	You encoded one instance, not the process. Test on three different inputs before you trust it.
It ignores half its own instructions	Too long, or internally contradictory. Cut it to the rules that actually change the output.
Nobody else can use it	It assumes context only you have. Either state that context or move it into the Project.

EXERCISE 4 · SKILL

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

Still in the Project, paste this.

Context	We just scored four organizations on generative engine visibility: collect the sub-metrics, normalize each to the leader, roll up to Presence, Appearance and Relevance, weight them, and grade.
Audience	Anyone on the team who needs a scorecard for a different competitive set, without me explaining the method.
Scope	The method, not these four companies. It should work for any set of two to six organizations.
Intent	I want the same scorecard, built the same way, every time, without rewriting this prompt.
Narrator	A methodologist writing instructions for a capable colleague who wasn't in the room.
Outcome	A Skill called geo-competitive-scorecard. A description that says when to use it. Then the steps in plain English, the weighting and grading rules, and the three things that most often go wrong. Then test it on a set of competitors we didn't use today and show me the result.

How you know it worked: If it only works on the original four, you encoded an instance, not a method.

SCENARIO 2 · CONTENT AND EDITORIAL

Still in the Project, paste this.

Context	Northwind has a style guide now. It's in this Project.
Audience	Anyone writing or editing for Northwind, including writers who have never seen the guide.
Scope	Editing, not writing from scratch. Change what breaks the guide and leave the rest alone.
Intent	Every draft should come back in our voice without anyone pasting the guide into a prompt.
Narrator	A careful copy editor who explains every change.
Outcome	A Skill called northwind-voice-edit. Given a draft, it returns the edited version, then a short list of each change and the rule behind it, then anything the guide doesn't cover. Test it on a paragraph that's badly off-voice (write one with three exclamation points and the word "revolutionary") and show me what it does.

How you know it worked: Also test it on one of the published posts. It should change almost nothing.

SCENARIO 3 · REPORTING AND PERFORMANCE

Still in the Project, paste this.

Context	We just built the monthly readout by hand: the finding first, then the numbers, then the recommendation, using the definitions in this Project.
Audience	Whoever produces the monthly readout, including whoever covers for me.
Scope	Any month's channel data, in the same columns.
Intent	The same readout, with the same definitions, every month, without rebuilding the prompt.
Narrator	A reporting lead writing the runbook.
Outcome	A Skill called monthly-channel-readout. It takes the latest month's rows and returns: the one finding that matters most, the numbers behind it with the arithmetic shown, what changed from last month, and one recommendation with what it would cost. Put the metric definitions in the Skill itself. Then test it on April to July only, and show me the July readout.

How you know it worked: A good July readout should already see paid search efficiency sliding. If it needs August to notice, the Skill is too timid.

EXERCISE 4 · SKILL

The prompt for your scenario (continued)

SCENARIO 4 · PROCESS AND DOCUMENTATION

Still in the Project, paste this.

Context	We just turned messy onboarding notes into an owned, numbered process with its failure points.
Audience	Anyone in operations with a process that lives in someone's head or a stale document.
Scope	Any process described in rough notes. Work only from what's written.
Intent	I want every undocumented process we find turned into something ready to hand off, the same way every time.
Narrator	The operations lead, writing the method down.
Outcome	A Skill called process-from-notes. It returns the process as a numbered sequence with an owner for each step, the failure points ranked by what they'd cost, the questions someone has to answer before it's final, and a TRIPS read on which step is worth automating first. Test it on a different process you know, even one written in five lines.

How you know it worked: Thin notes should produce a long list of open questions, not a confident-looking process.

SCENARIO 5 · MEETINGS TO ACTIONS

Still in the Project, paste this.

Context	We just turned a meeting transcript into an owned list of commitments.
Audience	Anyone who runs or attends a recurring meeting.
Scope	Any meeting transcript. Only commitments actually made.
Intent	Every meeting ends with owners and dates, without anyone writing them up.
Narrator	A chief of staff, writing the method down.
Outcome	A Skill called meeting-to-actions. It returns a table of owner, commitment and due date; a list of things raised but not assigned; a flag on every implied date; a flag on any commitment with no owner; and a two-line summary of what was decided. Test it on a transcript from a meeting you were in, or a short made-up one.

How you know it worked: The test that matters: does it leave a discussion as a discussion?

EXERCISE 4 · SKILL

Your notes

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
Stop rewriting the same prompt	The quality bar leaves when they do	The standard, written down	Claude or Code	It holds on an input you did not plan for

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask what they're re-explaining, the tasks people quietly dread repeating are your Skill backlog, and they already know what's on it
- Ask for the quality bar to be written into the Skill, not kept in someone's head. That's the part that leaves when they do
- Review the Skill itself, not just its output. It's plain language; you can read it and tell whether it's right

What process did you encode? What did you deliberately leave out?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Stage 2 to Stage 3. The process runs without you rebuilding it every time.

EXERCISE 5

Plugin

Hand it to your team

WORKS ON **WEB** Cloud connectors only **DESKTOP** Yes **MOBILE** Cloud connectors only

A Plugin bundles Skills, and the connectors they need. Into one thing a colleague can install. It is the step where a personal trick becomes something the organization owns.

DO THIS WHEN

- More than one person needs to run it
- You are the bottleneck and would rather not be
- You want the capability to outlive your involvement

SKIP IT WHEN

- Genuinely nobody else needs it, then it stays a Skill, and that's fine
- It isn't stable yet; packaging a moving target multiplies the churn
- You haven't checked what your organization permits

THE PROMPT — Your scenario's prompt is on the pages right after this one, ready to copy. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- Someone installs it and succeeds without asking you a question
- The description tells a stranger when to reach for it
- You stop being copied on requests you used to do by hand

WHEN IT GOES SIDEWAYS

What you'll see	What to do
Nobody installs it	The description was written for you, not for them. Rewrite it as when-to-use, not what-it-does.
IT exercises it	Expected at an enterprise. Bring a working Plugin and a security answer rather than a request.
It gives the wrong answer at scale	This is the real risk of packaging. A Plugin nobody maintains spreads a stale answer faster than the right one ever spread.

EXERCISE 5 · PLUGIN

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

Once the Skill has worked on a second set of competitors, paste this.

Context	The geo-competitive-scorecard Skill works, and I've tested it on a second set of competitors.
Audience	Colleagues who have never seen it and won't ask me before they use it.
Scope	Bundle the Skill and the connector it needs for current data. Nothing else.
Intent	I want other people running this without me being the bottleneck.
Narrator	A product manager writing for a stranger.
Outcome	A Plugin with a one-line description that says when to reach for it, not what it does. Add a short note on what it does badly, so nobody over-trusts it. For example: it can't see mentions behind paywalls, and a small organization will always look weak on Presence.

How you know it worked: Give it to one colleague with no explanation. If they have to ask you anything, rewrite the description.

SCENARIO 2 · CONTENT AND EDITORIAL

Once the Skill passes both tests, paste this.

Context	northwind-voice-edit works on drafts I didn't write, and leaves good copy alone.
Audience	The marketing team, our two freelancers, and the product managers who write the spec sheets.
Scope	The Skill, plus the style guide it depends on.
Intent	One voice across everyone who writes for us, without me reviewing every draft.
Narrator	A product manager writing for a stranger.
Outcome	A Plugin with a one-line description that says when to reach for it. Package the style guide in, so the Skill never runs without it. Add a short note on what it does badly: it can't check facts, and it will smooth out a technically correct sentence if nobody's watching.

How you know it worked: Give it to someone who writes spec sheets. If they can't tell when to use it from the description alone, rewrite the description.

SCENARIO 3 · REPORTING AND PERFORMANCE

Once the Skill has handled a month it hadn't seen, paste this.

Context	monthly-channel-readout works on a month it hadn't seen.
Audience	Marketing and finance. Finance has to recognize the numbers as theirs.
Scope	The Skill and its metric definitions.
Intent	Marketing and finance reading the same numbers, calculated the same way.
Narrator	A product manager writing for a stranger.
Outcome	A Plugin with a one-line description that says when to reach for it. Add a short note on what it does badly: it only knows the channels in the file, it can't explain causes the data doesn't show, and it will treat a tracking change as a real trend unless someone tells it.

How you know it worked: Show finance the definitions before anyone else installs it. If they'd calculate it differently, fix it now.

EXERCISE 5 · PLUGIN

The prompt for your scenario (continued)

SCENARIO 4 · PROCESS AND DOCUMENTATION

Once the Skill has handled a second process, paste this.

Context	process-from-notes works on a process it didn't see today.
Audience	The operations team, and any manager who inherits a process.
Scope	The Skill only.
Intent	Documentation stops depending on one person noticing it's missing.
Narrator	A product manager writing for a stranger.
Outcome	A Plugin with a one-line description that says when to reach for it. Add a short note on what it does badly: it can only document what's written down, and it will make thin notes look finished. The open-questions list is not optional.

How you know it worked: If someone skips the open questions and ships the process, the Plugin did its job and the governance didn't.

SCENARIO 5 · MEETINGS TO ACTIONS

Once the Skill has handled a second transcript, paste this.

Context	meeting-to-actions works on a transcript it hadn't seen.
Audience	Managers who run recurring meetings.
Scope	The Skill. If your transcripts live in a notetaker with a connector, include that connector.
Intent	Follow-up stops depending on whoever took notes.
Narrator	A product manager writing for a stranger.
Outcome	A Plugin with a one-line description that says when to reach for it. Add a short note on what it does badly: it can't tell a joke from a commitment, it only knows who said what if the transcript labels speakers, and it will miss anything agreed in the chat or after the call.

How you know it worked: Hand it to a manager who wasn't at today's workshop. If the description doesn't tell them when to use it, rewrite it.

EXERCISE 5 · PLUGIN

Your notes

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
Stop being the bottleneck	Who installs it, who approves it	Maintenance has a named owner	Anywhere your team already works	Somebody succeeds without asking you

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask who else needs it. If the answer is nobody, it stays a Skill
- Ask for the description to be written for the person who's never seen it
- Establish where Plugins live and who approves them before you have fifteen of them
- Budget the maintenance; an unmaintained Plugin is a liability, not an asset
- If you're on Enterprise, ask whether automatic security scanning of third-party Skills and Plugins is switched on, it shipped in August and it's the answer IT will want

What did you package? Who's the first person you'd give it to?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Stage 3, across the team. Same rung, a lot more people standing on it.

EXERCISE 6

Scheduled task

Make it run without you

WORKS ON **WEB** Yes **DESKTOP** Yes, and it must be open for local tasks **MOBILE** Check them in the Scheduled tab

Point Claude at a Skill you've built and tell it when to run. It executes on that cadence and hands you the result, whether or not you remembered.

DO THIS WHEN

- The answer changes on a predictable rhythm
- Somebody currently has a recurring reminder to go do this
- You want to be told what changed rather than going to look

SKIP IT WHEN

- The answer doesn't actually change that often. Be honest
- Nobody reads the output of the last recurring thing you set up
- It leaves the company without a human looking at it first. That's Stage 4 governance you don't have yet

THE PROMPT — Your scenario's prompt is on the pages right after this one, ready to copy. Don't retype it from the screen.

WHAT GOOD LOOKS LIKE

- It arrives, somebody reads it, and occasionally it changes a decision
- It tells you what changed, not just what is
- You'd notice and care if it stopped

WHEN IT GOES SIDEWAYS

What you'll see	What to do
It didn't run	If it needs anything on your computer, the desktop app has to be open when it fires. Cloud-only tasks run regardless.
It runs and nobody reads it	Wrong cadence or wrong output. Cut the frequency in half and lead with the delta.
It ate your usage	Heavy model on a routine job, or too frequent. Both are fixable in about a minute. See the next section.

EXERCISE 6 · SCHEDULED TASK

The prompt for your scenario

SCENARIO 1 · COMPETITIVE ANALYSIS

Create a scheduled task, set its model to Sonnet, and paste this as its instructions.

Context	Run the geo-competitive-scorecard Skill on the same four organizations.
Audience	Me first. The leadership team only if something moved.
Scope	Quarterly, on the first business day of the quarter.
Intent	I want to know what changed since last quarter, not reread the same scorecard.
Narrator	An analyst writing for someone with five minutes.
Outcome	The delta summary first. Flag anything that moved more than 10 points, and tell me if any source went stale or failed to refresh. The full scorecard underneath. Nothing goes to leadership until I've read it.

How you know it worked: Ask yourself honestly how often these numbers change. If the answer is "not quarterly," change the cadence.

SCENARIO 2 · CONTENT AND EDITORIAL

Create a scheduled task, set its model to Sonnet, and paste this as its instructions.

Context	Our published posts, in [the folder or site section where they live], and the style guide in this Project.
Audience	Me, and our lead editor.
Scope	Posts published in the past week only. Every Monday morning.
Intent	I want to catch drift from our voice before it becomes the new normal.
Narrator	The same copy editor, reporting instead of editing.
Outcome	A short note: which posts drifted, the specific sentences, and the rule each one breaks. If nothing drifted, one line saying so. Don't edit anything that's already published.

How you know it worked: If it flags the same thing three weeks running, the problem is the guide, not the writers.

SCENARIO 3 · REPORTING AND PERFORMANCE

Create a scheduled task, set its model to Sonnet, and paste this as its instructions.

Context	Run the monthly-channel-readout Skill on the newest export in [the folder or Drive location where it lands].
Audience	Me first. The CEO once I've read it.
Scope	Monthly, on the third business day, after the month has closed.
Intent	I want to walk into the month knowing what moved, without building the report.
Narrator	The same analyst, writing for someone with five minutes.
Outcome	The finding first. Flag it if paid search efficiency drops below 2.0, or any channel moves more than 15 percent month over month. If the export is missing or the columns have changed, tell me instead of running on partial data. Nothing goes to the CEO until I've read it.

How you know it worked: The failure check is the line that matters. A report that runs quietly on half the data is worse than no report.

The prompt for your scenario (continued)

SCENARIO 4 · PROCESS AND DOCUMENTATION

Put 04-Process-Distributor-Accounts.csv in [the folder or Drive location the task can read]. Create a scheduled task, set its model to Sonnet, and paste this as its instructions.

Context	04-Process-Distributor-Accounts.csv lists every distributor account with its type, who set it up, setup date, whether the tax certificate is on file, and first order date. The onboarding process is in this Project.
Audience	Tom Beckett, who owns onboarding.
Scope	Every account with no first order yet, however old. Every Monday morning.
Intent	No account goes more than 14 days without a first order without someone knowing.
Narrator	An operations coordinator who keeps things moving without drama.
Outcome	A short list: every account past 14 days with no first order, days since setup, who set it up, and the next step from the process. Separately, any account missing a tax certificate. If nothing needs attention, one line saying so.

How you know it worked: Run it once by hand today. Harbor Point Industrial should be at the top, and it's been waiting since May.

SCENARIO 5 · MEETINGS TO ACTIONS

Create a scheduled task, set its model to Sonnet, and paste this as its instructions.

Context	The commitments tracker in this Project.
Audience	The four attendees, through me.
Scope	Every Friday at noon. Commitments due in the next seven days, plus anything overdue.
Intent	Nothing slips because people forgot, and nobody has to chase.
Narrator	A chief of staff who is firm and never passive-aggressive.
Outcome	A short digest grouped by owner: what's due next week, what's overdue and by how long. Draft a one-line reminder for each owner for me to send. Don't send anything yourself.

How you know it worked: "Don't send anything yourself" is the governance line. Keep it until you trust the output.

EXERCISE 6 · SCHEDULED TASK

Your notes

THE FIVE REQUIREMENTS, FOR THIS EXERCISE

PURPOSE	PEOPLE	PROCESS	PLATFORM	PERFORMANCE
It happens whether or not you remember	Who reads it, and who acts on it	Cadence matched to how fast things change	Claude or Code	The delta, not the re-run

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask what the cadence is based on. How often the underlying thing changes, not how often the meeting is
- Ask what happens when it fails. A silent broken task is worse than no task, because everyone assumes it ran
- Ask what it costs to run, this is where usage becomes a line item rather than an experiment
- Require a human review point on anything that leaves the company

What did you schedule, and how often? What would make you turn it off?

What I'd do differently next time

Who I need to talk to about this

Where this puts you: Stage 3 to Stage 4. It runs unsupervised, which is exactly why the governance question arrives here.

What not to do

The expensive mistakes. Some of these are mine, and I'd rather you didn't have to make them yourself.

✗ Don't schedule everything daily

Ask honestly how often the answer changes. Most things people set to daily are monthly at best, and nobody reads the other twenty-nine. A weekly digest people open beats a daily one they filter.

✗ Don't run your heaviest model on routine work

I left a batch of scheduled tasks running on my most expensive model, all set to fire on the first of the month. I showed up Monday with no usage left for the week. Match the model to the job.

✗ Don't skip the review step

The step everybody skips is reading the output critically before building on it. Every exercise in this workbook compounds, an error in Exercise 2 is still there in Exercise 6, wearing better clothes.

✗ Don't encode a process you've never done by hand

If you can't describe the steps and the judgment calls, you can't encode them. Do it manually twice, badly, and then automate what you learned.

What not to do (continued)

✗ Don't put confidential material somewhere you haven't checked

Know your organization's policy before you upload client data, personnel files, or anything under NDA. Sample data exists for exactly this reason. Use it in the room.

✗ Don't mistake a faster wrong answer for progress

Speed is the easiest thing to get from these tools and the least valuable. The point is better decisions, and a confidently wrong one arrives faster than it used to.

✗ Don't automate the thing nobody asked for

The most common wasted AI project is a beautifully automated process that nobody was struggling with. Start with the task people dread, not the one that's easiest to automate.

The pattern under all of these: know what you're doing before you start. It's the same discipline as software development — you write the requirements before you touch the code. It saves rework, it saves money, and it's the difference between a tool and a toy.

What works where

Checked against Anthropic's documentation and the product itself, 30 September 2026. The last two columns assume the desktop app is *not* running — that's the case that trips people up.

Capability	Claude	Code	Web, no desktop	Mobile
Research	Yes	Limited	Yes	Yes
Projects	Yes	Own kind, beta	Yes	Yes
Artifacts	Yes	Team/Ent.	Newer only	Artifacts tab
Skills	Yes	Yes	Yes	Yes
Plugins	Yes	Yes	Cloud ones	Cloud ones
Scheduled tasks	Yes	Yes	Yes	Yes
Local file read/write	Desktop	Desktop	No	No
Cloud connectors	Yes	Yes	Yes	Yes
Browser use	Desktop or Chrome ext.	Chrome ext.	Chrome ext.	No
Computer use	Desktop	No	No	No

Why they're different

Claude always runs somewhere else. The model lives in Anthropic's cloud. Laptop, browser or phone, the thinking happens on their servers. No surface gives you a smarter Claude.

What changes is reach. Your hard drive can only be touched by a program running on your machine. A browser tab is sandboxed on purpose — that's every browser, not a decision Anthropic made. The desktop app is a program you installed and gave permission to.

The desktop app is a bridge, not a box. Leave it open and a session you started on your phone reaches your files through it. It isn't "web can't" — it's "something has to be running on the computer."

Four things need something running on your own computer: local file access, local connectors, browser use, and computer use. For browser use, that can be the Claude in Chrome extension instead of the desktop app. Everything else works anywhere you can sign in.

The sample material, and when to use it

You do not have to put real company material in front of a room of strangers on conference wifi. Everything demonstrated today runs on a complete worked example you can use instead.

The worked example: Trust Insights vs. Deloitte, McKinsey and BCG

A real GEO visibility analysis, already run, on four organizations nobody minds being compared. It runs end to end through all six exercises, so you can follow along on the same subject Katie is demonstrating and compare your output against a finished one.

File	What it is	Use it in
01-Competitive-Visibility-Data.csv	16 visibility metrics for four organizations, already collected	Every exercise
01-Competitive-Synthetic-Deep-Research-Report.md	What Exercise 1 produced, with every source listed	Exercise 1, to compare or as a stand-in
01-Competitive-Worked-Example-Scorecard.csv	The finished scores, grades and ranks	Exercise 3, to check your work
01-Competitive-Worked-Example-Bar-Chart.png, -Radar-Chart.png	The finished scorecard as charts	Exercise 3
01-Competitive-Worked-Example-Skill.md	The scoring method, written as a Skill	Exercise 4, to compare
01-Competitive-Worked-Example-Plugin.plugin	The same Skill, packaged to hand out	Exercise 5, to compare

When to reach for it

USE THE SAMPLE MATERIAL WHEN

- Your own competitive position, client data or numbers are sensitive
- You can't get to your files — no desktop app, locked-down laptop, or the VPN is being the VPN
- You'd rather learn how it works first and point it at real material on Monday
- You fell behind and want to rejoin at the current exercise without rebuilding three exercises first

USE YOUR OWN WHEN

- You have something real and non-sensitive to hand
- You want to leave with an asset rather than an exercise
- Your scenario isn't competitive analysis. The structure transfers, the subject doesn't have to

Straight about this: all five scenarios have sample data, a prompt for every exercise, and a stand-in Exercise 1 result. The sample pack has two folders: Sample Data, and Example Outputs, both organized by exercise. The competitive one also has a finished worked example, so if you want to compare your output against a completed one, use that. The six moves are identical either way.

When it's Claude Code instead

Not a harder version of what you just learned — the adjacent one. It isn't "Claude for coders" either; it's Claude pointed at a working directory. The qualifier isn't whether you write software, it's whether the work lives in files and there's enough of it that consistency and a reviewable record matter.

You want...	Reach for	Because
An answer	Claude	It's a question, not a project
A deliverable	Claude	Something you can open, use and send. Pick the format from Output
A change across many files	Code	You need to see what changed before you accept it

The worked example: fixing a content library for GEO

Everyone is being told GEO matters. Far fewer are being told how to repair three hundred existing posts — the part that decides whether anything changes.

WHY THIS IS A JOB FOR CODE

- The repair is structural and identical every time: question-first headings, a self-contained answer up top, claims that survive being quoted out of context, your company named instead of "we," consistent schema and freshness data
- None of it is creative — the same handful of edits, three hundred times, and by post sixty a person has drifted. You're also editing live, ranking content, so you need to read a diff before accepting it and be able to put it back
- It's a standard, not a one-time fix — which makes it a **Skill**, and the quarterly re-check a **scheduled task**

THREE CAUTIONS, WORST FIRST

The risk	What to do about it
Being confidently wrong at scale	GEO practice is unsettled. An unproven standard across the whole library means every page is wrong the same way. Treat the standard as a draft.
Doing all three hundred at once	Do twenty, measure, then widen. A bad standard then costs you twenty pages, not the library.
Nobody can tell whether it worked	Decide how you'll measure AI citations and referral traffic *before* you change anything.

WHAT TO ASK FOR, IF YOU'RE NOT THE ONE BUILDING IT

- Ask who already lives in files and exports. Usually not your engineers — it's ops and analytics, the highest-yield people nobody thinks to ask
- Ask to see the diff before anything publishes. That one request is most of the governance this needs
- Don't push it on people whose work isn't file-shaped — that's a tool looking for a problem. And budget for it: long agentic runs consume usage fastest

When something doesn't work

The questions that come up every single time.

Why can't the web app see my files when the desktop app can?

A browser tab isn't allowed to read your hard drive. True of every website, and deliberate. The desktop app is a program you installed and gave permission to. Upload the files, or connect a cloud source like Drive or SharePoint, which works from anywhere.

I built it on my laptop. Why can't I open it on my phone?

Sessions, Projects and files sync across all three. Mobile has its own Artifacts tab, so start there. If something doesn't display well on a small screen, open it on a laptop. Mobile is for checking in and steering; building is easier on a bigger screen.

Do I get a worse Claude in the browser?

No. The model is identical, it runs in Anthropic's cloud whichever surface you opened. What you don't get is Claude reaching onto your own machine.

My scheduled task didn't run.

If it needs anything on your computer, your desktop app has to be open when it fires. Tasks that only touch cloud sources run regardless of whether your machine is on.

Isn't memory the same thing as a Project?

No, and the difference matters. Memory is what Claude picks up about you as you work. Automatic, individual to you, and nobody else can see or inherit it. A Project is context you put in deliberately: structured, auditable, and available to anyone with access. Memory makes one person faster. A Project makes an organization faster. Check which you actually have before you argue about it: memory is on by default on Free, Pro and Max, and off by default on Team and Enterprise.

My IT won't let me install anything. What am I giving up?

Local file access, local connectors, browser use and computer use. That's the complete list, and browser use also works through the Claude in Chrome extension if IT allows extensions. All six exercises are still available to you.

On Windows, the desktop app can't work with my files.

The desktop app needs Windows' Virtual Machine Platform turned on to work with your files. If you see a "Missing HCS services" error, that's one for your IT team. Use the web app in the meantime: every exercise works there.

Claude won't make a file, and my Project is missing.

You're almost certainly in incognito (the ghost icon). Incognito chats can't create files or run code, and they aren't available in Projects. Turn it off and start a new chat. Worth knowing: incognito isn't saved to your history or memory, but it's still included in your organization's data exports and kept for 30 days. More at support.claude.com/en/articles/12260368-use-incognito-chats

Vocabulary: the tools

Enough to hold your own in the meeting where somebody uses these interchangeably.

Claude

The main app, on web, desktop and mobile. Conversations, research, files, Projects, artifacts, Skills, Plugins and scheduled tasks all live here. Until September 2026 this was two tabs, Chat and Cowork.

Code

Claude pointed at a folder of files. It makes changes you can review line by line before you accept them. Runs on web, desktop, mobile and in the terminal. Optional for everything here.

Incognito

A chat that isn't saved to your history or memory. It can't create files or run code, and it isn't available in Projects, so turn it off for this workshop. It is still included in your organization's data exports, so it doesn't mean your employer can't see it. More at support.claude.com/en/articles/12260368-use-incognito-chats

Project

A persistent workspace holding context. Files and standing instructions. Shared by every conversation inside it.

Artifact

A real output you can open and send: a document, dashboard, page or calculator, rather than text in a chat.

Skill

An instruction set Claude loads automatically when relevant. Your process and quality bar, written down.

Plugin

A package of Skills, plus the connectors they need, that other people can install.

Connector

A link to a data source. Cloud connectors (Drive, SharePoint, Slack) work anywhere; local ones need the desktop app.

Scheduled task

A job that runs on a cadence you set and returns the result without you starting it.

Model

Which version of Claude does the work. Heavier models cost more of your usage. Match the model to the job.

Memory

What Claude picks up about you as you work. Your role, your preferences, your projects. Personal, automatic, and not transferable. On by default on personal plans, off by default on Team and Enterprise.

Documents, presentations and designs

Real, editable files Claude makes in a conversation. They live in Artifacts: start one from the Artifacts page, or pick it from Output in the composer. Shareable by link, and exportable to Word, PowerPoint, Google Docs or PDF. Beta, paid plans.

Vocabulary: the frameworks

The four Trust Insights frameworks this workbook runs on, and what each one decides.

5P Framework by Trust Insights™

Purpose, People, Process, Platform, Performance. Five questions that scope the work before you pick a tool.

TRIPS

Time, Repetitiveness, Importance, Pain, Sufficient data. Scores whether a task is worth handing to AI at all.

Five Stages of AI Maturity

Done by You, with You, for You, without You, ahead of You. Where the work sits on the human-effort curve.

CASINO

Context, Audience, Scope, Intent, Narrator, Outcome. How to write a prompt worth the compute.

How they fit together

Ask this	Use
Is this task worth handing to AI at all?	TRIPS
What are the requirements?	5P Framework by Trust Insights™
How do I write the prompt?	CASINO
Where does this work sit, and what moved it?	Five Stages of AI Maturity

In order: TRIPS decides whether. The 5P Framework by Trust Insights™ gathers the requirements. CASINO writes those requirements down as a prompt. The Five Stages tell you what you just moved.

The Five Stages of AI Maturity

Where the work sits on the human-effort curve — and what today actually moved.

TRUST INSIGHTS FRAMEWORK

1 Done by You — 100 percent HUMAN EFFORT

WORKFLOW

Where everyone starts. You do the work; AI isn't in the loop.

2 Done with You — 60–70% HUMAN EFFORT

AUTOMATION

AI drafts, summarizes and assists. Most daily tasks belong here.

3 Done for You — 10–20% HUMAN EFFORT

AGENT

It runs the process; you review and approve. Power-user territory.

4 Done without You — 1–5% HUMAN EFFORT

AUTONOMOUS

It runs unsupervised. Needs real governance before you go here.

5 Done Ahead of You — 0 percent HUMAN EFFORT

ANTICIPATORY

It acts before you ask. Long horizon; not a current build priority.

What each exercise moves

Exercise	Moves you	Why
Exercises 1 & 2. Research and Project	Stage 1 → 2	Claude starts doing real work with your context behind it.
Exercise 3. Artifact	Still Stage 2	The output is finally usable by somebody else, but you still start it.
Exercise 4. Skill	Stage 2 → 3	The process is encoded, so it runs without you rebuilding it.
Exercise 5. Plugin	Stage 3, across the team	It stops being yours and becomes something the organization owns.
Exercise 6. Scheduled task	Stage 3 → 4	It starts without you. This is where governance stops being optional.

Almost nobody should be aiming for Stage 5. Most organizations get real value living well at Stage 2 and running a handful of things at Stage 3. Stage 4 is a governance question long before it's a technology question.

Where you go from here

Not all six. The next one, on the task that scored highest on TRIPS.

If today you...	Your next move	Moves you to
You mostly use AI to draft and summarize	Build the Project. Load your context once and stop re-explaining your business.	Stage 2
Your context is already loaded	Turn your most-repeated task into a Skill.	Stage 2 to 3
You have Skills you use yourself	Package one as a Plugin and get a second person using it.	Across the team
Your team is on Plugins	Schedule it, measure what changed, and report that number.	Stage 3 to 4
You want structured practice	Claude Academy launched in August. Courses, tutorials and badges, free and self-paced.	

My commitment

The one exercise I'm going to build, on the use case I picked

---

By when

Who else needs to know about it

One exercise, on one use case, is a realistic month. Write a date. The people who put a date on it are the ones who still have this running at the end of the quarter.

Staying in touch

If this was useful and you want more of it: Trust Insights publishes a weekly newsletter on exactly this kind of thing, and we do this work with clients directly — AI strategy, measurement, and getting teams past the experimenting stage.

trustinsights.ai · krobbert@trustinsights.ai

Bring me the thing you wrote down on page four. I'd genuinely like to hear whether it worked.
