Introduction

This workbook follows the live Google Gemini for Business workshop at MAICON 2026. Keep it open during the three breakout sessions: it gives you the tool links, steps from the slides, practical guidance, and sample prompts you can adapt to your work.

The workshop's goals are to help you understand the Google AI ecosystem, discover capabilities worth knowing, and put Google AI to work faster. You'll practice thinking through a business problem, researching and organizing knowledge, and building and improving a small app.

What's In This Workbook

The workbook contains three guided breakout sessions and a reference section of capability maps.

- **Breakout Session 1: Gemini** — Use Gemini as a strategic thought partner: explain a real business problem, add context, explore issues and drivers, generate solutions, and decide what to do next.
- **Breakout Session 2: Deep Research & Gemini Notebook — Try a sample research prompt and notebook, create your own report and notebook, and optionally generate content assets from your notebook.**
- **Breakout Session 3: AI Studio** — Build a marketing budget planner from the workbook prompt, change its inputs, request an improvement, test and refine it, and try an app for your own work.
- **Capability Maps** — Explore the tools covered in the workshop, discover additional features, and follow official Google links to learn more.

How to Use This Workbook

Before the First Breakout

Open the workbook beside the tool you will use. If you want to type notes into the Google Doc, choose File → Make a copy first. If you are using the PDF, keep notes in a separate file. Sign in with an account your organization permits; you can practice with fictional or non-sensitive material when needed.

These are the tool entry points; each breakout also repeats the link it uses:

- Gemini
- Gemini Notebook
- Google AI Studio

During Each Breakout

When Mike starts a breakout, jump to that section. Read the Goal, open the tool under Links, and follow the Steps in order—they match the exercise slides.

Each step includes Advice explaining how to approach it. Where helpful, you'll also find Sample Prompts to copy and try, Example Problems to spark ideas, Questions to Consider, or Example Tests to check your results. Use the workbook's steps and prompts as your starting point; Mike's demos are examples, and your results may differ.

Replace any blue bracketed text with your own information before submitting a prompt. Choose the sample prompts that help you move forward—you do not need to try every example.

Capture What You Learn

After each breakout, write a few notes in your own copy or another file: the problem or idea you chose, the most useful result, what still needs checking, and your next action. If a research report or app is still running when the group moves on, continue with the group and return to it later. After the workshop, use the Capability Maps to explore more features and official links.

If You Get Stuck

- **Accessing Tools** — If you cannot access a tool using your work account, try a personal Google account if permitted, using sample or non-sensitive material. Account features and limits may differ. Ask a facilitator if you still cannot get access.
- **Missing Files or Context** — If you cannot connect or upload work materials, describe the relevant context using information you are permitted to share, or practice with a fictional example.
- **Slow Tools or Failed Outputs** — If Gemini or other tools move slowly or fail in their output, try again. If you run into persistent problems, move to the next step where possible and return to the result later or ask a facilitator for help.
- **Need Help** — If you need help with anything at all, ask a facilitator at any point.

Breakout Session 1: Gemini

Goal

Use Gemini as a strategic thought partner to clarify a real business problem and decide what to do next. Speak instead of typing if you can, give Gemini the context it needs, and use follow-up questions to test your thinking.

Links

- Gemini

Steps

Step 1: Choose a real work problem.

Advice:

Pick something where you're uncertain what to do, not just something you need written. Choose a problem you understand well enough to discuss, ideally with relevant files or context. If nothing comes to mind, use one of the examples below.

Use voice to explain the problem naturally and get more context into Gemini in less time. Typing is fine if speaking isn't practical.

Start your prompt with: I'm trying to work through [describe your problem]. Help me think it through and decide what to do. Add the interview instruction in Step 2 before submitting.

Example Problems:

- We're generating more leads, but qualified sales opportunities aren't growing…
- We have more requests for content and events than our team can deliver…
- My content gets engagement, but I'm struggling to show how it contributes to business results…
- I see a better way to work, but I need buy-in from people I don't manage…
- AI is changing my role, and I need to decide which skills and responsibilities to invest in…

Step 2: Have Gemini interview you.

Answer one question at a time, adding facts and correcting assumptions as you go.

Sample Prompt:

- "I'm trying to work through [describe your problem]. Help me think it through and decide what to do. Before suggesting solutions, interview me one question at a time to understand the situation, what I'm trying to achieve, and what's getting in the way."

Step 3: Connect relevant Workspace context.

Advice:

Consider the Google Workspace material that would help Gemini understand this problem.

How to add context: In the same Gemini conversation, type @ and select Google Drive, Gmail, or another available app. Ask Gemini to find the relevant file or information using its title or specific keywords, and use it to understand your problem. Make sure you're signed in to the account that holds that material. Open the sources Gemini cites to confirm it found the right information.

If the app isn't available, paste a permitted excerpt or summarize the context yourself, then keep going.

Important Note: *Add only sources you are allowed to use or that fall under your permitted usage of AI at your company.*

- **Gmail** — Relevant customer or team threads may show requests, objections, feedback, and decisions.
- **Drive and Docs** — Briefs, plans, meeting notes, policies, and prior analyses can show goals, constraints, and what has already been tried.
- **Sheets** — Metrics, budgets, forecasts, or timelines can test the scale of the problem. Give the date range and explain key measures.
- **Slides** — Approved strategy, positioning, or project presentations can show the intended direction and rationale.
- **Calendar** — Deadlines, meetings, and time constraints can matter when choosing a next move.

Step 4: Identify the issues and drivers.

Advice:

Ask Gemini to identify the key issues and drivers behind your problem. Separate established facts from assumptions, and correct anything it has misunderstood.

Sample Prompts:

- "What are the key issues and drivers behind this problem? Separate what we know from what we are assuming."

Step 5: Go deeper on the problem.

Advice:

Stay in the same conversation. Choose the questions below that help you weigh the issues and drivers, consider other perspectives, reframe the problem, or find missing information. Check Gemini's reasoning against what you know before moving to solutions.

Sample Prompts:

- “Help me weigh the issues and drivers. Which have the greatest effect on the outcome, what evidence supports each, and what are we still assuming?”
- “How might the people affected see this problem differently? What would change about our approach if we took their views seriously?”
- “What other ways could we frame the problem? Which framing would be most useful to test first, and why?”
- “What important questions haven’t I asked yet? Ask the most consequential one now.”
- “What would we need to learn before choosing where to focus? Identify the biggest gaps and a practical way to investigate each.”

Step 6: Generate possible solutions and stress-test your choice.

Generate possible solutions

Advice:

Ask for several distinct approaches and compare their trade-offs against your goal and constraints. Use a follow-up prompt to explore an overlooked option or a smaller version you could try.

Sample Prompts:

- “Give me three genuinely different ways forward. For each, explain what it addresses, what we gain, what we give up, and what must be true for it to work.”
- “What is a less obvious approach we may be overlooking?”
- “What could we do with the people, budget, tools, and information we already have?”
- “Which of these approaches could be combined into a small pilot without creating a large new project?”

Stress-test your choice

Advice:

Choose the approach that looks most promising, then ask Gemini to challenge it. Finish with one practical next action or small test, including what you need to learn before committing further.

Sample Prompts:

- “Which option best fits my goal and the evidence we have? Make the case, then give me the strongest argument against it.”
- “Assume the approach I am leaning toward fails. What are three plausible reasons, and what could I change now?”
- “What evidence would change your recommendation?”
- “What small test should I run before committing further? Define what I would do, what I would observe, and what each result would mean.”

Step 7: Stretch goal: Turn your solution into something you can use.

Advice:

Choose a useful output: a proposal in Docs, a tracking sheet in Sheets, or a message to get buy-in. Use the conversation and relevant Workspace files to create it. Review the result and refine it until it is useful for your next action.

Sample Prompt:

“Turn the solution we’ve developed into [deliverable] for [audience]. Make it specific enough that I can use it to [next action].”

Breakout Session 2: Deep Research & Gemini Notebook

Goal

Try Deep Research and a shared sample notebook, then create a research report and notebook for your own work. If time allows, generate content assets from your notebook.

Links

- Gemini
- Gemini Notebook

Steps

Step 1: Run the sample Deep Research prompt.

Advice:

Open Gemini, choose Deep Research, and use one of the sample prompts below. Review the proposed plan and adjust its scope if needed, then start the research. **Continue to Step 2 while it runs.**

Sample Prompts:

- "Research how B2B buyers discover information and evaluate vendors, and what recent, credible studies say about the role of thought leadership and educational content. Include hidden stakeholders and self-directed research. Favor original studies, distinguish reported preferences from measured behavior, note where findings differ, cite sources, and end with questions a marketing team should test."
- "Research how people use AI assistants, search engines, and social platforms to discover products and services. Compare recent usage studies, note differences by audience and purchase type, and separate observed behavior from predictions. Cite original sources and flag what remains uncertain."
- "Investigate what recent research says about trust in online reviews, influencer recommendations, and brand claims. Compare who was studied and how, explain when these sources help or mislead a purchase decision, and cite the original evidence."
- "What does evidence say about the effect of in-person events versus webinars on professional learning and business relationships? Find credible studies, distinguish attendee opinions from measured outcomes, and explain where comparisons are weak."
- "Research how organizations are training employees to use generative AI. Compare documented programs, adoption barriers, and measured results. Separate vendor claims from independent evaluations and identify what remains untested."
- "Investigate how expectations for self-service and human support are changing in customer service. Compare consumer and B2B evidence, identify situations where each is preferred, and cite original studies."

Step 2: Explore a sample notebook while it runs.

Advice:

Choose any sample Notebook below and explore the material already in it. Ask questions, compare sources, open citations, and review any existing outputs. These are shared examples for exploration. **Use your own Notebook in Step 4 when you want to add sources or create content.**

Sample Notebook: Product Catalog

Explore SmarterX's AI Academy courses and programs, the topics they cover, and who they are designed to help.

Sample Prompts:

- "How do AI Fundamentals, Piloting AI, and Scaling AI differ in what they teach and who they are for? Walk me through how the learning progresses from understanding AI to applying it and leading adoption."
- "I'm a [role] and want to get better at [skill or business goal]. Which courses in this catalog are most relevant, and what would I learn in each? Explain which one would be the best starting point for me."
- "Which courses cover identifying AI use cases, building AI assistants, and preparing a team for AI adoption? Explain how those topics connect and point me to the relevant course descriptions."

Sample Notebook: Brand Guidelines

Explore the fictional Fieldwork brand's positioning, audiences, voice, visual identity, and approved examples.

Sample Prompts:

- "Help me understand Fieldwork's brand. Who is it for, what problem does it solve, and what makes its positioning distinctive? Connect those ideas to examples in the source material."
- "What does 'clear, practical, and calmly confident' mean for Fieldwork's voice? Walk me through specific wording in the approved copy and explain how it demonstrates the voice principles."
- "How does Fieldwork communicate differently on its homepage, in an educational email, and in sales outreach? Compare the existing examples and explain how audience intent shapes the message and call to action."

Sample Notebook: Customer Feedback

Explore three sample survey groups and customer interviews about campaign planning, content review, and workflow reporting.

Sample Prompts:

- “What do customers value most, and what frustrates them most, in campaign planning, content review, and workflow reporting? Walk me through each survey group separately and include representative comments.”
- “Go deeper on onboarding and setup. What are customers trying to accomplish, where do they get stuck, and how do the interviews help explain the survey responses?”
- “How do customer needs differ by role or team size in these sources? Explain the differences using specific comments and interview passages, especially around approvals, visibility, and reporting.”

Sample Notebook: 2026 B2B Buyer Research

Explore research on how B2B buyers discover information, develop trust, and use thought leadership and educational content to evaluate vendors.

Sample Prompts:

- “How do B2B buyers use thought leadership and educational content as they discover a problem, explore solutions, and evaluate vendors? Walk me through the journey using findings from the research.”
- “Who are the hidden stakeholders in a B2B buying decision, and how does thought leadership reach or influence them? Explain what the sources say about their priorities and their role in the decision.”
- “What makes business content useful and trustworthy to buyers? Go deeper on the qualities, formats, and sources buyers value, and explain how those preferences connect to vendor evaluation.”

Sample Notebook: Content Library

Explore the archive of The Artificial Intelligence Show to find discussions, examples, and connections across episodes.

Sample Prompts:

- “What are the most useful discussions in this library about getting an organization started with AI? Identify the relevant episodes and explain the practical ideas Paul and Mike explore in each.”
- “Help me understand AI agents through this podcast library. How are they described, what examples are discussed, and how does the conversation develop across episodes?”
- “Find the episodes that go deepest on [topic]. Explain the main ideas and examples in each, how the discussions connect, and which episode would be the best starting point for learning about it.”

Step 3: Create your own Deep Research report.

Advice:

Choose a research question that matters to your work. Adapt a prompt from Step 1 or use the template below. Tell Gemini what you need to understand, why it matters, and the scope. Review the research plan, then start the report. While it runs, begin gathering sources for your notebook in Step 4. When it is ready, read the findings and open the sources behind important claims.

Sample Prompt:

- "I need to understand [topic] so I can [decision or goal]. Research [key questions] for [audience or market]. Focus on [time period or scope]. Use credible, original sources, cite the evidence, and flag gaps or uncertainty."

Step 4: Create your own notebook.

Advice:

Choose a focused topic or collection that would be useful in your work. Open Gemini Notebook, select New notebook, name it clearly, and add a few relevant sources using Add sources. Start with documents, PDFs, copied text, or web links you are allowed to use.

You can also build from your research: export the report to a Google Doc and add it as a source, then add the original sources you want to question directly. A generated report is a synthesis, so keep its underlying evidence available.

Ask a question you need answered, follow up to go deeper, and open a citation to check the source. Use the prompts below to start exploring your collection.

Questions to Consider:

- What information do I or my team repeatedly look up?
- What material do I keep explaining to coworkers, customers, or partners?
- What related sources or insights do I keep piecing together that would be more useful in one place?
- What topic do I need to learn quickly, but rarely have time to study in full?
- What content have we already created that we could find, question, and reuse more often?

Sample Prompts:

- "Using these sources, what should [audience] understand about [topic]? Cite the supporting material and identify gaps this collection cannot answer."
- "What questions could this notebook help my team answer repeatedly? Give me five practical examples and identify any sources we should add."

Step 5: Stretch goal: Generate content assets from the notebook you create.

Advice:

In your own notebook, open Studio and choose a content format, such as an Audio Overview, slide deck, video overview, or report. Customize it for your audience, topic, or purpose, then generate it. Review the asset and check that it reflects your sources. Use your own notebook for this step, rather than the shared sample notebooks.

Example Instructions:

- “Create an Audio Overview that explains [topic] to [audience]. Focus on the key ideas and practical implications in these sources.”
- “Create a slide deck for [audience] explaining [topic]. Focus on the findings they need to understand and the questions they should consider next.”

Breakout Session 3: AI Studio

Goal

Practice using Google AI Studio to build, test, and improve a small app through focused prompts.

Links

- Google AI Studio

Steps

Step 1: Build your app using a workbook prompt.

Advice:

Open Google AI Studio using the workbook link. If you aren't already on the app-building screen, select Build. Paste the budget-planner prompt below into a new app and let it build the first version. Open the app preview when it is ready. Your design may look different from the demo; use the workbook's budget values and requirements as your starting point.

Sample Prompts:

- "Build a simple marketing budget planner. I want to enter a total budget, allocate money to three marketing activities, and see how much is left. Keep it on one screen. Let me edit the activity names and amounts. Show the total allocated and the remaining balance clearly. Start with a $10,000 budget, $4,500 for paid ads, $3,000 for content and SEO, and $1,500 for social. Use ordinary arithmetic for the calculations."

Step 2: Try the app and check its results.

Advice:

Use the app preview to change the total budget and individual allocations. Check the results yourself. With the workbook's starting values, the total allocated should be $9,000 and the remaining balance should be $1,000.

Example Tests:

- Change social from $1,500 to $3,000 while keeping the total budget at $10,000. Expect $10,500 allocated and a $500 overage.
- Keep those allocations and raise the total budget to $12,000. Expect $1,500 remaining. Then restore the starting values before your next test.

Step 3: Describe one improvement in plain language.

Advice:

Choose one useful change: simplify the design, clarify a label, fix a problem, or add a feature. Describe what you want to happen and inspect the result before asking for another change. Use whichever sample fits what your app needs.

Sample Prompts:

- "This is too cluttered. Make it one compact screen. Keep only the total budget, three editable activity names and amounts, the total allocated, and a large remaining balance. Remove extra controls and charts."
- "Make the labels easier to understand at a glance. Keep all calculations and inputs the same."
- "Change only the layout: [describe what you want]. Do not change the budget logic."
- "Add a simple horizontal bar chart below the calculator showing each activity allocation and the remaining budget. Update it as I change the amounts. Keep everything else as it is."
- "Add a reset button that restores the starting budget and allocations. Confirm that it also clears any error message."
- "Let me save or copy a short text summary of the budget and allocations. Do not add sign-in or a database."
- "Add [one feature I want]. Keep the app small and preserve the behavior we already tested."

Step 4: Test and iterate.

Advice:

Repeat the budget tests after each change. Try a negative amount, an empty field, and a decimal. If you added a feature, test it too. Describe what you entered, what you expected, and what happened. Use Restore on an earlier checkpoint if you want to return to a previous version, then test again.

Sample Prompts:

- "When I change social from $1,500 to $3,000, the total allocated should be $10,500 and the remaining balance should show a $500 overage. Fix the calculation or display if either result is wrong."
- "I tested a negative amount, an empty field, and a decimal. Here is what happened: [describe the results]. Recommend how the app should handle each case before you change the code."
- "When the allocations exceed the budget, make the overage impossible to miss. Show exactly how much we are over in red. Keep the rest of the app the same."
- "If someone enters a negative amount, show a clear error beside that field. Do not update the balance until they fix it. Keep the rest the same."

- “I tested [input]. I expected [result], but the app showed [actual result]. Fix that behavior without changing the design or other calculations.”

Step 5: Stretch goal: Build an app for your own work.

Advice:

Break your work into tasks, including recurring work and one-off requests. Choose something worth improving that you can try with the tools and information you have. Start with clear inputs, visible rules, and an output you can test.

Choose something you or a coworker could use repeatedly: enter information, adjust inputs, and see the results. A calculator, planner, or tracker is a useful starting point. Describe the simplest version to AI Studio, then build and test it.

Sample Prompts:

- “Build a simple campaign capacity planner. Let me enter each project, its estimated hours, and the team’s available hours this week. Show total demand, remaining capacity, and any overage. Make every estimate editable.”
- “Build an event break-even calculator. Let me enter fixed costs, cost per attendee, ticket price, and expected attendance. Show the break-even attendance and estimated surplus or shortfall, with the formulas visible.”
- “Build a simple [type of app] for [who will use it]. They need to [task]. The inputs are [inputs], the rules are [rules], and the output should be [output]. Start with the smallest useful version and use sample data.”

Capability Maps

This reference shows what each tool can do beyond the live exercises. Start with the features highlighted in the workshop deck, then scan the additional features when you want to explore a new use case. Availability, limits, and sharing rules can vary by account and may change.

***Note:** AI moves fast, and features are subject to change.*

Gemini

Gemini is Google's general-purpose AI assistant for thinking, creating, and solving problems. Open it at gemini.google.com. These eight highlighted features match the workshop deck.

Highlighted Features

- **Reasoning Models** — Choose a faster or deeper model to match the task, from quick drafting to complex analysis and coding.
- **Voice** — Speak your instructions and context instead of typing; use live conversation where supported.
- **Google Workspace** — Bring permitted files and connected app context into Gemini, then continue in the Workspace apps where you work.
- **Skills (Formerly Gems)** — Save instructions for a repeatable task and reuse them without rewriting the full prompt. Skills in Gemini chat currently require a personal Google Account; availability in Workspace Studio follows a separate rollout.
- **Scheduled Actions** — Have a prompt run at a chosen time or on a recurring schedule.
- **Image and Video Generation** — Create and edit visual ideas and short video content through conversation.
- **Gemini in Chrome** — Ask about open pages and, where available, navigate or work in the browser with Gemini.
- **Gemini Spark** — Delegate longer-running tasks across connected services on eligible personal accounts with a Google AI Pro or Ultra subscription.

Additional Features

Think and Research

- **Model and Mode Choice** — Switch among available Flash-Lite, Flash, Pro, or deeper-thinking options; availability and limits vary. For the exercise, start with a model that keeps the conversation moving. If the results aren't useful, first improve your context and guidance; then consider a more capable model or higher reasoning effort.
- **Search Grounding and Sources** — Use current web results, inspect source links, and challenge claims before relying on them.
- **Files and Data** — Upload or attach documents, PDFs, images, spreadsheets, and other supported files; ask for comparisons, calculations, or charts.
- **Deep Research** — Commission a multistep investigation with a proposed plan, selected sources, and a report you can question.

- **Notebook Context** — Bring an eligible Gemini Notebook into a chat so sources and instructions can inform new work.

Create and Iterate

- **Canvas** — Develop and revise documents, code, and working app prototypes beside the conversation.
- **File Creation and Export** — Move useful responses into supported Google files or copy and share them for further editing.
- **Audio and Music** — Listen to responses, make audio overviews, or generate music where those tools are available.
- **Learning Tools** — Use guided learning, quizzes, flashcards, practice tests, and study guides.
- **Response Controls** — Regenerate, branch, pin, search, share, or export chats; review available source and citation controls.

Personalize and Act

- **Connected Apps** — Connect eligible Google or third-party services and ask Gemini to retrieve context or perform supported actions.
- **Calendar, Tasks, and Notes** — Check or manage events, reminders, and notes through supported connected apps.
- **Instructions and Memory** — Set personal instructions and, where eligible, let Gemini use previous chats or connected data to tailor responses.
- **Custom Apps** — Connect approved custom tools through supported app or MCP options where available.
- **Chrome Skills and Browsing** — Reuse browser methods and use supported page, tab, image, or history context in Chrome.
- **Mobile and Live** — Use Gemini on supported phones, wearables, vehicles, or headsets and talk through camera or screen context where available.
- **Account and Data Controls** — Check plan, administrator settings, activity retention, sharing, privacy boundaries, and tool permissions before using work data.

Gemini in Workspace

Gemini works inside Google Workspace apps and can draw on permitted context across them. This map expands on the Workspace context introduced in Part 1; it is a supplementary reference, rather than a separate capability-map slide. Exact features differ by app, account, and administrator settings.

Highlighted Features

- **Docs** — Draft, revise, summarize, and style documents using instructions and relevant source material.
- **Sheets** — Organize and analyze data, create formulas, classify information, and visualize results.
- **Slides** — Create and refine slides or presentations with prompts and source material.
- **Meet** — Capture meeting notes, decisions, and next steps, then use the resulting notes.
- **Gmail** — Summarize threads, find information, draft replies, and manage follow-up work.
- **Cross-App Functionality** — Choose context from multiple Workspace sources and create files or take supported next actions from the app you are using.

Additional Features

Find and Use Context

- **Source Controls** — Choose which accessible files or apps Gemini can use, inspect citations, and reconcile conflicting evidence.
- **Drive Search and Research** — Search files with AI, summarize folders or documents, catch up on changes, and investigate a topic using accessible Drive material.
- **Cross-App Actions** — Create or update supported files and tasks from another Workspace app without manually copying all the context.
- **Personal Instructions and Skills** — Save preferences or reusable methods where available and use eligible Gems or Skills inside Workspace.
- **Integrations** — Search supported third-party services from eligible Workspace apps; check each integration's access and read-only limits.

Write and Present

- **Docs Editing and Style** — Write, rewrite, match an existing style, work through comments, and generate or edit images where available.
- **Docs Audio and Live** — Listen to a document or use supported live voice editing and discussion features.
- **Notebook Sources in Docs** — Ground a Docs draft in an eligible Gemini Notebook and inspect the cited source material.
- **Slides Generation** — Create an editable presentation or individual slides, revise text, and generate visuals.
- **Google Vids and Pics** — Turn briefs or slides into videos; use supported voiceovers, clips, avatars, music, and image editing where available.

Analyze and Coordinate

- **Sheets Canvas and AI Function** — Explore analysis in Canvas, create tables or charts, and apply Gemini or AI functions to rows at scale.
- **Smart Fill and Table Help** — Infer patterns, fill or classify cells, and organize data with supported table features.
- **Gmail Search and Writing** — Use AI summaries and search, draft or proofread messages, suggest replies, and plan meeting times.
- **Meet Assistance** — Ask about a meeting, take notes, summarize progress, translate speech or captions, and use supported audio and video enhancements.
- **Chat and Calendar** — Find or summarize conversations, draft messages, suggest meeting times, and act on relevant follow-ups.
- **Forms** — Create forms from a request and summarize response themes where available.
- **Permissions and Governance** — Check data access, sharing, retention, usage limits, administrator controls, and whether a feature is enabled in your Workspace edition.

Deep Research

Deep Research is an on-demand research workflow available in Gemini and Gemini Notebook. It investigates sources and returns a report you can question and reuse. In Gemini, you can review and edit the research plan before it starts. The four highlighted features below match the workshop deck.

Highlighted Features

- **Research Plan** — Review and edit the proposed plan before the research begins.
- **Sources** — Combine web research with selected accessible files, Gmail, Drive, or notebooks where supported.
- **Research Report** — Get a structured report with source links and follow-up questions.
- **Create from Research** — Turn findings into supported visual, interactive, or document outputs where available.

Additional Features

Scope the Investigation

- **Research Brief** — State the decision, audience, scope, time horizon, comparison criteria, and what evidence could change your mind.
- **Source Selection** — Choose or exclude Google Search, connected Workspace sources, uploads, and eligible notebook context before running.
- **Plan Revision** — Check the proposed questions, methods, alternatives, and missing perspectives; edit the plan before starting.
- **Model and Access** — Choose an available research model and check plan, age, account, region, and usage limits.

Inspect and Use Results

- **Cited Synthesis** — Read the report with source references and open consequential citations to check the underlying material.
- **Follow-Up Questions** — Ask for uncertainties, competing interpretations, missing evidence, or a decision-focused summary.
- **Visual Reports** — On eligible plans, add charts, diagrams, or interactive explanations when compatible with the selected sources.
- **Export and Reuse** — Copy, share, or export the report to supported Google formats, then use it as context for another task.
- **Research from Other Surfaces** — Start supported Deep Research steps from Workspace Studio or other eligible Google surfaces where available.
- **Evidence Limits** — Separate what a source says from Gemini's inference; verify claims, dates, and permissions before acting.

- Gemini
- Gemini Apps Help

Gemini Notebook

Gemini Notebook (formerly NotebookLM) is a source-centered workspace for collecting material on a topic, asking questions about it, and turning it into useful formats. Open it at notebook.google.com. The six highlighted features below match the workshop deck.

Highlighted Features

- **Add Sources** — Bring documents, PDFs, websites, YouTube videos, audio, and supported Google files into one focused notebook.
- **Chat with Sources** — Ask questions across selected sources, compare what they say, and open citations to check the supporting passage.

- **Audio Overviews** — Turn sources into podcast-style AI discussions you can listen to and, on supported versions, interact with.
- **Video Overviews** — Generate narrated visual explanations from the source material.
- **Create Content** — Make reports, mind maps, infographics, slide decks, tables, quizzes, and flashcards from the notebook.
- **Use in Gemini** — Bring the notebook into Gemini to work on a new problem, plan, or project with that context.

Additional Features

Find and Organize Evidence

- **Fast Research** — Search the web or your accessible Drive files for candidate sources, review the results, and import only the ones you want.
- **Deep Research in Notebook** — Run a broader web investigation, then import its report and selected sources into the notebook.
- **Source Controls** — Select which sources a question or output should use; label and group sources; refresh supported Drive material when it changes.
- **Notes as Working Material** — Write notes or save useful chat answers as source material. New notes appear in the Sources panel; older Studio notes can be converted to sources.

Ask and Analyze

- **Custom Chat** — Set the notebook's response style, length, and instructions; inspect source citations and ask follow-up questions.
- **Experimental Agentic Chat** — Where available, ask Notebook to search the web, run code, build charts or files, and revise generated outputs. Check its work closely.
- **Data Tables** — Structure information across sources into rows and columns, customize the question, and export the result to Sheets for review.

Make and Reuse Outputs

- **Reports** — Create briefing documents, FAQs, study guides, or custom reports; supported interactive reports can embed other notebook outputs.
- **Mind Maps** — Explore source topics as a branching diagram and ask questions about a selected node.
- **Flashcards and Quizzes** — Generate practice material, adjust focus or difficulty, and revisit missed items.
- **Infographics** — Turn source material into a visual summary with choices for layout, detail, language, and style.
- **Slide Decks** — Generate detailed or presenter slides, revise a generated deck, and download supported formats.
- **More Audio and Video Options** — Choose supported overview formats, languages, focus, and audience; availability varies by plan and device.

Share and Continue Working

- **Sharing and Copies** — Grant Viewer or Editor access, share a link, and allow eligible collaborators to copy a notebook. Check source access before sharing.
- **Public and Featured Notebooks** — Explore published examples or, where supported, share your own notebook more broadly.
- **Usage Analytics** — For eligible shared notebooks, see recent querying users and query counts.
- **Mobile App** — Add supported sources, chat, listen to audio, and create selected outputs on the go; some desktop features are unavailable.
- **Settings and Alerts** — Set output language and appearance, organize notebooks, and receive supported completion notifications.

Access and Judgment

- **Account Access** — Features and quotas depend on your Workspace or personal plan, administrator settings, age, region, and rollout. Check your own account before planning around a feature.
- **Grounding and Review** — A citation shows where to check a claim, not that the claim is correct. Review original sources, especially for a decision or public-facing output.
- **Gemini Integration** — Notebook names, sources, and instructions can sync with Gemini. Gemini may also use web tools, while the standalone Notebook experience centers on selected sources. Shared notebooks—including ones you own—do not appear in Gemini; access them in Gemini Notebook. Studio outputs such as Audio Overviews and slide decks are created in Gemini Notebook, not Gemini.

Use Notebook Context Elsewhere

- **Google Docs** — On eligible accounts, reference an existing notebook from Gemini in Docs to ground a draft in its sources and inspect citations.
- **Workspace Studio** — In eligible workflows, add text, Drive links, or web and YouTube URLs to a notebook automatically.
- **Google Play Books** — Add eligible ebooks you purchased as sources; collaborators need their own copy to use that book in a shared notebook.
- **Search AI Mode** — Eligible personal accounts can use a notebook in Google Search AI Mode. Chat grounding and history differ from the standalone Notebook.

AI Studio

Google AI Studio is a browser workspace for trying Gemini models and building working apps. Open it at aistudio.google.com; model access, data terms, billing, and deployment are separate decisions.

Highlighted Features

- **Build Mode** — Describe an app in plain language and get a working preview with generated code.
- **Conversational Editing** — Change the app by asking for a feature, fix, or design revision, then test the new version.
- **Gemini Capabilities** — Add supported chat, voice, image, video, and other model features to an app.
- **Workspace Integrations** — Connect supported Workspace services so an app can work with a user's authorized data.

Additional Features

Experiment with Models

- **Prompt Playground** — Try a model with instructions, examples, files, images, audio, video, or other supported inputs before building.
- **Model and Setting Choice** — Compare available models, response settings, reasoning, token use, and output behavior.
- **Live and Streaming** — Prototype real-time voice and multimodal interactions where supported.
- **Tools and Grounding** — Test supported search, URL context, code execution, function calling, or other model tools.
- **Structured Output** — Ask for predictable JSON or schema-shaped responses for app logic.
- **API Code and Keys** — Export starter code and manage Gemini API credentials for a separate application.

Build and Test Apps

- **App Gallery and Imports** — Start with a prompt, remix a gallery app, or import a supported GitHub project.
- **Full-Stack Web Apps** — Generate client and server code, use packages, manage server-side secrets, and connect to external APIs.
- **Native Android Apps** — Generate a Kotlin and Jetpack Compose app, preview it in an emulator, and test on a device.

- **Workspace APIs** — Add sign-in and scoped access to supported Gmail, Drive, Docs, Sheets, Slides, Calendar, and other Workspace services.
- **Persistent Data and Collaboration** — Add supported storage, authentication, or real-time shared state when the app needs them.
- **Code and Preview** — Inspect generated files, test the live preview, report bugs, and iterate until the behavior is right.
- **Share and Deploy** — Share a prototype or deploy a supported web app; check what is public, who can sign in, and which services it can access.

Access and Judgment

- **Pricing and Limits** — Check AI Studio and Gemini API quotas, paid tier requirements, and Cloud billing before scaling or deployment.
- **Data-Use Terms** — Review the applicable service and data-use terms before entering confidential or regulated material.
- **App Security** — Keep secrets on the server, grant only needed permissions, and test error handling and data access before sharing.

Workspace Studio

Workspace Studio is Google's flow builder for repeatable work across Workspace apps. The three highlighted capabilities match the workshop deck. Open it at studio.workspace.google.com if your account has access.

Highlighted Features

- **Flows** — Automate a sequence of steps from a manual, scheduled, or supported event starter.
- **Workspace Apps** — Move work across Gmail, Sheets, Docs, Drive, Chat, Calendar, and other supported Workspace apps.
- **AI Actions** — Use Gemini inside a flow to summarize, extract, draft, classify, or make a decision.

Additional Features

Start and Shape a Flow

- **Natural-Language Builder** — Describe the workflow you want, inspect the proposed steps, and edit them before turning the flow on.
- **Templates and Starters** — Begin from a template or start manually, on a schedule, or from supported Gmail, Chat, Sheets, Drive, Forms, or meeting events.
- **Conditions and Loops** — Use Decide, Check if, Filter a list, and Repeat for each to route work and process multiple items.
- **Variables** — Pass information from a starter or earlier step into later instructions and actions.
- **Skills** — Turn a repeatable method into a reusable Skill, use it in a flow, or trigger an eligible flow from it. Access is rolling out gradually and depends on your Workspace administrator's settings.
- **Grounding** — Give AI steps the right file, email, or other context, and check what information a step can access.

Take Actions Across Apps

- **Gemini Steps** — Ask Gemini, using Skills where available, to summarize, extract, recap unread email, draft content, or run supported Deep Research.
- **Notebook Steps** — Ask an eligible Gemini Notebook or add new source material to one automatically.
- **Gmail and Chat** — Draft, send, label, archive, or reply to mail; send notifications, messages, posts, or replies in Chat.
- **Docs, Drive, and Sheets** — Create or append a Doc, manage files and folders, read or update Sheet rows, and save attachments.
- **Calendar and Tasks** — Block time, set up meetings, add guests, or create tasks.
- **Third-Party and Custom Steps** — Use supported integrations, webhooks, or custom add-on starters and steps where enabled.

Run and Govern

- **Test Runs** — Run a flow on sample inputs or manually where supported, inspect results, and repair failures.
- **Approvals** — Require a review before specified actions when the available approval controls support it.
- **Sharing and Ownership** — Share a flow or Skill under your organization's policy and understand whose access it uses.
- **Activity and Limits** — Review run history, troubleshoot failures, and check step, trigger, and usage limits.
- **Administrator Controls** — Admins can manage service access, sources, sharing, data loss prevention, audit logs, and flow activity.

Antigravity

Antigravity is Google's agent system for complex knowledge and coding work across files, tools, and the browser. The three highlighted capabilities match the workshop deck. Start at antigravity.google.

Highlighted Features

- **Agents** — Give an agent an outcome and let it plan, execute steps, and return work for review.
- **Files, Terminal, and Browser** — Let an agent read and change files, run commands, and interact with the web under chosen permissions.
- **Parallel Agents** — Run multiple agents or subagents on separate parts of a larger job.

Additional Features

Organize and Direct Work

- **Projects** — Group conversations, files, and permissions around a body of work; use supported folders or Git worktrees.
- **Plans and Artifacts** — Review an implementation plan, changes, screenshots, diagrams, files, or browser recordings before accepting the result.
- **Model Choice and Boost** — Choose an available model or deeper reasoning mode for the difficulty of the task.
- **Task Groups and Subagents** — Coordinate related agents, delegate specialized subtasks, and monitor progress.
- **Remote Control** — Follow and direct a supported running task from another device.
- **Sidecars and Schedules** — Run persistent helper processes or scheduled work where the surface supports them.

Extend the Agent

- **Agent Skills and Rules** — Save reusable instructions, tools, examples, and project guidance so the agent can apply a method consistently.
- **MCP and Plugins** — Connect approved external tools or packaged capabilities to expand what the agent can read or do.
- **Hooks** — Run configured actions at supported points in the agent lifecycle.

- **Google Build Integrations** — Use supported Google services or bundles in a project when the task needs them.
- **SDK** — Build custom agent applications with tools, personas, policies, subagents, structured outputs, and streaming.

Work Across Surfaces

- **Desktop App** — Manage agents and review knowledge or coding tasks in the standalone application.
- **IDE and Editor** — Work beside code with agent assistance, task controls, completion, and review tools.
- **CLI** — Start, resume, and inspect agent work from a terminal with supported commands.
- **Browser Interaction** — Let the agent inspect pages, navigate sites, and capture recordings under browser permissions.
- **Terminal and File Permissions** — Choose execution and sandbox modes, then review the access an agent needs before it acts.
- **Sharing and Enterprise Controls** — Check plan, quota, organization access, security settings, and data handling before using sensitive work.
