This is the example data we are using today in the BUILD session:

https://www.trustinsights.ai/downloads/maicon2026/exampledata.csv

See the appendix for how to find this data for yourself.

Ads! Ads! Ads!

Courses:

- Introduction to Deep Research with AI
- AI for Writers (And Writing)
- GEO 201 for Marketers
- GEO 101 for Marketers
- The AI Ready Strategist
- Mastering Prompt Engineering for Marketing
- Generative AI Use Cases

Books:

- 21 Use Cases of Generative AI For Marketers
- Almost Timeless: 48 Foundation Principles of Generative AI
- Generative AI for SEO and PPC Marketers
- Generative AI for Destination Marketers

Skills for Claude and Agentic AI:

- The Highly Opinionated Agent Skill Fixer - repair your GPTs, Gems, and Skills for the modern agentic era
- Deep Research Suite - learn how to create and build effective, low hallucination deep research.
- LLMs.txt Skill - generate an llms.txt file for your site based on your real data.
- Job to AI Skill and Plugin - unpack any job description into what AI can and can't do

Subscriptions:

- The Prompt Playbook - collections of prompts from my channel and newsletters, delivered weekly

Customized consulting: If you love the promise of analytics, data science, and AI but don't love the huge amount of work that goes into fulfilling that promise, from data governance to agentic AI deployment, let us do it for you. We've got more than a decade of real-world AI implementation (AI existed long before ChatGPT) built on your foundational data so you can reap the benefits of AI while your competitors are still figuring out how to prompt.

Keynote talks and workshops: Bring Trust Insights to your event! We offer customized keynotes and workshops for conferences, company retreats, executive leadership meetings, annual meetings, and roundtables. Every full-fee talk is customized to your event, industry, or company, and you get the talk recording and materials (transcripts, prompts, data) for your audience to work with and learn from.

Prompts

Copy and paste the entire green highlighted section for each prompt. Fill in any yellow highlights.

Google AI Mode Search Prompt

I am using {Mac/Windows/Linux} and my computer has {XX GB of RAM} and {XYZ graphics card}. Based on these specs, recommend a FOSS (free open source software) ASR (automatic speech recognition) software package I can install to transcribe me speaking that is private, secure, fast, and efficient. Show your results in descending order by best fit.

Exercise 1: Inventory & Enabled Approaches

Using Python and importlib.metadata, list all the available Python libraries available to me here, grouped by functional category. Make your results available as a downloadable Markdown file named python-inventory.md. Once done, then based on the available Python libraries, make a list of the analytical methods and techniques that we can perform in this environment successfully. Examples might be things like RFM analysis from retail, time series forecasting, etc. Think across domains, disciplines, and professions by the most commonly used analytical techniques in the NAICS top level codes, and list the analytical techniques by top level code that this environment supports. Make your results available as a downloadable Markdown file named analytics-enablement.md

Exercise 2: Approach Selection & Execution

Using the included Markdown files of installed Python libraries and analytical techniques, your built-in Python interpreter, and the Google Search Console Generative AI CSV, choose 1-3 analytical approaches based on available libraries and analytical methods. Consider what techniques out of the marketing domain might lend unique insights. Examine the data available including what's possible with feature engineering and extraction. Which are the best fit for this data, regardless of domain, that answers our stakeholder's key question about AI visibility: what pages and categories of topics were cited most in Google AI Search, so that they know what to do more or less of in terms of content creation? Analytical approach should include methods, outputs, and formats. Ask me up to 20 clarifying questions for things you can't infer from the data until you have enough information to succeed at the task of choosing an analytical approach. Select up to 3 different approaches based on fit, then execute the approach and show the results as an HTML file with PNG charts where appropriate. The results should be in the Trust Insights SAINT framework: summary, analysis (what happened), insights (why things happened), next steps, timeline for decisions.

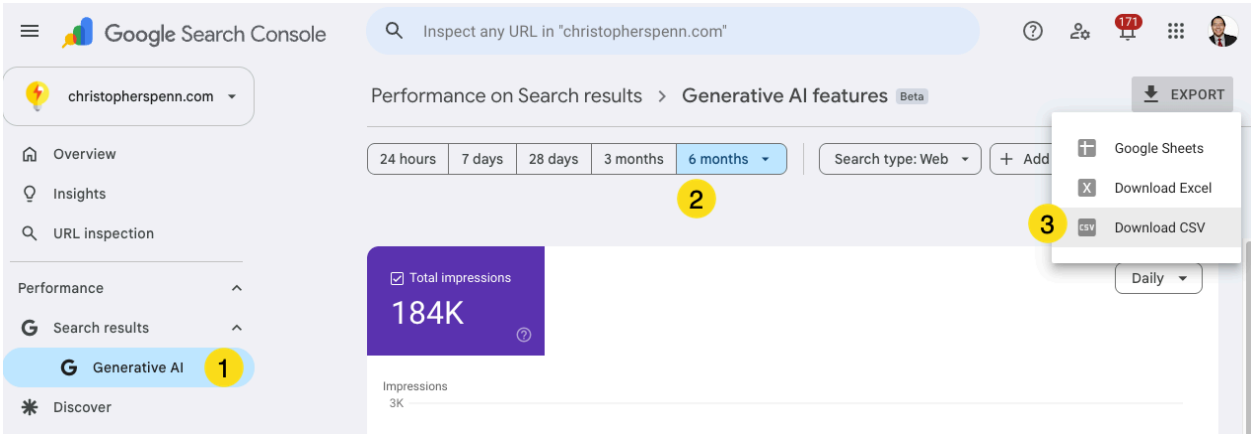

Homework: Turn into a Reusable Skill

Using the strict standards from https://agentskills.io/specification, take our entire conversation, apply the 5P Framework by Trust Insights™ at https://www.trustinsights.ai/5p-framework , and create a SKILL.md skill with supporting Python scripts, reference materials, assets, templates, and appropriate evaluations. The root SKILL.md is a thin orchestration layer only. Evals must evaluate whether the skill invokes correctly, whether the skill accomplishes the task, and whether the skill is token-efficient. Token efficiency is achieved by making the skill as deterministic as possible, using the Python libraries in the environment. Create the folder structure, files and provide the skill as a downloadable ZIP file. Ask me up to 20 clarifying questions until you have enough information to succeed at the task.

The 5P Framework by Trust Insights™:
PURPOSE: What are we doing and why?
PEOPLE: Who will use the outputs?
PROCESS: What steps must the AI get right or include?
PLATFORM: What tools and data are we providing?
PERFORMANCE: What is the concrete, measurable definition of done?

Appendix: How to find your AI visibility data in Google Search Console

If you want to use your own Google Search Console AI visibility data, export it by selecting Generative AI under the Performance > Search results menu [1], then choose a 6 month timeframe (no AI data is available prior to May 18, 2026) [2], then choose Export > Download CSV [3]. Unzip the file to find the Pages.csv and use that for prompts 3 and 4.
