Build the Project Plan That Runs Itself: The Playbook That 3x'd My Project Throughput

Date & time: Oct. 15, 11:40 AM-12:25 PM
Track: Build

Rachel Woods

CEO & Co-founder, AMP (AI Momentum Protocols)

- LinkedIn

Session Description

You've used AI to write the email. You've used it to draft the brief. So why does the campaign still take six weeks?

Because the bottleneck was never the writing; it was the plan. And most plans are still written for humans only.

In this hands-on session, attendees build a project plan the way I build mine: appetite fixed up front, then every task scoped with its own context, success criteria, and an explicit owner—a person or an agent. It's the single change that 3x'd my own project throughput, and it works on whatever they're actually shipping this quarter: a campaign launch, a webinar, a rebrand, a content engine. They bring a real project. They leave with it planned.

Leave this session with:

- A pitch that locks appetite before scope creep eats it
- A full task breakdown, each task labeled human-run, AI-run, or AI-drafts/you-approve
- Task specs written so an agent can actually execute them (context, instructions, success criteria, output format)
- The reusable playbook, so the next project takes an hour instead of a day.

Level: Intermediate: Comfortable with and have paid access to ChatGPT or Claude day to day, no code required. Attendees should bring a laptop and one real project they need to ship in the next 90 days.

Key Quote

> *"It's boring operations, but I promise it's really sexy when you start doing it because now you have something that you don't have to fight with."* **- Rachel Woods**

Session Summary

Rachel Woods, CEO and co-founder of AMP (AI Momentum Protocols), an AI operations education and implementation firm, led this hands-on Build track session on what she calls the

playbooking method. Woods, who has worked in AI for about a decade starting on Facebook's AI research team, opened with a story from earlier this year: too sick to get out of bed, she typed a single command, "todaying," and her AI agent ran her morning routine and the rest of her playbooks. It handled her inbox, rescheduled or canceled meetings, sent sales follow-ups, revised and sent a client proposal, and answered a program inquiry that closed $2,500 in new revenue.

Her core message was the shift from simply using AI to operating with it: building systems and processes that AI follows reliably so the team can depend on its work instead of fighting with it. She framed the problem as operational debt, illustrated by projects already running behind, explaining the same thing repeatedly, and delegation that ends with "it's faster if I do it myself." Her advice was to approach AI the way you would train a human, essentially writing the employee handbook for the job. A playbook is a step-by-step document built on four components (trigger, inputs, steps, and outputs) that can run in any AI that follows instructions, from chatbots and agents to Copilot, ChatGPT, Gemini, Claude, and automation tools like Zapier, n8n, and Make.

Attendees copied a template and worked through Woods' project planning playbook, which she credits with her team now completing three times as many projects. Its steps clarify the project up front, apply the 1-3-1 approach (one problem statement, three possible solutions, one recommendation), build the timeline and tasks, draft the full plan, and then offer to start the tasks the AI can do itself. She encouraged writing each step like its own prompt, with clear instructions, background context, examples, response formats, and success criteria, and customizing the template to match how your organization defines tasks and deliverables. She then converted the playbook into a Claude skill and ran it live, showing the AI announce each step as it followed her process.

Woods closed with the rest of her craft cycle: get a clear picture of expectations, scope a realistic first version that is simply usable and useful (such as running it in chat and moving tasks into a project tool manually), build it, run a dedicated feedback cycle with a feedback log and minor versus major fixes, and plan a real team rollout with clear owners and habit stacking. From there, playbooks can be expanded and stacked; her todaying playbook creates ClickUp tasks that Claude monitors and executes using other playbooks, an approach she calls crafting yourself out of the loop. Her parting line: "remember, you can playbook that."

Key Takeaways

- **Operate with AI, don't just use it.** Build processes AI follows reliably so you can trust and depend on its work rather than correcting it.
- **Outline every playbook in four parts.** Define the trigger, inputs, steps, and expected outputs before asking AI to do any repeatable work.
- **Write each step like a prompt.** Clear instructions, background context, examples, response formats, and success criteria make each step more reliable.
- **Make version one usable and useful.** Scope down first, such as running the playbook in chat, and only check tool capabilities against the requirements you actually need.

- **Plan for feedback and rollout.** Keep a feedback log, triage minor and major changes, assign an owner, and use habit stacking so the team actually adopts the playbook.
- **Stack playbooks to craft yourself out of the loop.** Each new cycle hands AI more of the work, up to playbooks that assign and trigger other playbooks.
