How to Reimagine and Build Workflows that Weren't Possible Before

Date & time: Oct. 14, 11:40 AM-12:15 PM EST
Track: Strategic AI

Liza Adams

Founder, AI Advisor & GTM Strategist, GrowthPath Partners

- LinkedIn

Session Description

Most teams use AI to do old work faster. They draft emails, generate variations, and score leads. But doing faster work should not be all we do with AI. It's just a starting point.

The real opportunity is work that wasn't possible before. That's where growth comes from. You can't reimagine the future by automating the past.

There's a whole category of work your team isn't doing. Some of it you stopped because it was slow, manual, or expensive to do by hand. Some of it you never could.

- Reading your calls, reviews, and win/loss notes alongside analyst reports and competitor moves, to find the signal that only appears across all of it and what it should change about your positioning
- Seeing how AI describes and recommends you when buyers ask, and which sources it cites
- Testing your strategy against simulated buyer, competitor, and internal reactions before you commit to it

In this session, you'll learn how to:

- Identify which workflows are worth reimagining based on what AI does well that's hard for humans
- Rethink a workflow for the AI era instead of just automating the old way
- Design and build an agentic human+AI workflow, including instructions, skills, and human gates
- Watch a live build so you can apply the same approach with your team

Come with one workflow you'd rebuild if you could start over. You'll leave knowing whether it's still hard or just historically hard, and how to build it if it's the second one.

Key Quote

> *"Reimagining the org before we reimagine the work feels like hiring a bunch of actors when we don't know what the script is, or remodeling the kitchen when we don't know the lifestyle of the people who are going to live in it."* **- Liza Adams**

Session Summary

Liza Adams, Founder, AI Advisor & GTM Strategist at GrowthPath Partners, drew on her years as a CMO to show marketers how to use AI to do work that wasn't possible before. She was candid that she doesn't consider herself an AI expert or rely on playbooks, since she believes best practices now have a shelf life of weeks. Instead, she relies on pattern recognition from working with many marketing teams, and she ran her demo live so the audience could see "the good, the bad, and the ugly."

Her core argument was that teams have over-pivoted on making existing work faster, and that efficiency should be the floor of our expectations for AI, not the ceiling. Simply speeding up current work risks automating humans out, while reimagining work creates a better chance of growing the business. She urged the audience to ask whether a task is truly hard or just "hard historically," and to reimagine the work first, then the roles, then the organization. Her examples included pulsing the market on a schedule to assess product-market fit, keeping context intact across marketing, sales, and customer success, making sense of large volumes of data, and testing messaging with AI persona simulators before going in front of real buyers.

Adams then outlined four building blocks of an agentic workflow: context (the knowledge AI needs about your personas, ICP, KPIs, messaging, and brand voice), skills (how your company does things and its quality bar), instructions (the beginning, middle, and end of the workflow, including where to place human gates), and inputs that the workflow turns into outputs. She stressed that higher-risk, multi-step workflows need human gates more frequently, such as requiring AI to show its plan with pros and cons and wait for approval before creating assets.

In a live build in Claude, she ran an expansion and retention workflow from a project called Acme Account Planner. AI evaluated 10 customer accounts and produced a red, yellow, and green dashboard, flagging Norcastle Engineering as at risk even though its CSM platform scored it as healthy, because of an acquisition and a new CFO favoring a different platform. After she added a press release, a Gong transcript, and ROI data and approved the plan, the workflow produced an account brief, an interactive ROI calculator, and a sales follow-up email. She also showed a simulation in which an AI sales rep pitched an AI buying committee of travel, finance, and IT managers, ending with a round-by-round assessment of the rep's performance.

Adams explained that she built the instructions and skills by first working through the problem in a chat with Claude, then asking it to turn that work into a skill, instructions, and a list of must-have and nice-to-have context files. She emphasized that humans make the final call because they remain accountable, and closed with a call to upskill and reskill people and to give ourselves and others grace.

Key Takeaways

- **Efficiency is the floor.** Making existing work faster is a fine starting point, but reimagining work to achieve better outcomes is what gives marketing a higher probability of growing the business.

- **Ask if it's hard or just hard historically.** Work that was once too slow, manual, or expensive for humans, like pulsing the market daily or rationalizing massive data sets, may now be possible with AI teammates.
- **Reimagine work before the org.** Adams recommends reimagining the work first, then the roles, then the organization, rather than restructuring before knowing what the work will be.
- **Build workflows from four parts.** An agentic workflow needs context, skills, and instructions set up in advance, plus inputs that it turns into outputs such as dashboards, briefs, and calculators.
- **Place human gates by risk.** Multi-step, higher-risk workflows need checkpoints where AI shows its plan and waits for approval, because humans remain accountable for the final call.
- **Use AI to help you use AI.** Work through a problem once in chat, then ask AI to turn that work into reusable skills, instructions, and suggested context documents, and refine them through testing.
