(AI-Generated Session Notes)

The Playbook for Marketing Transformation

Date & time: Oct. 14, 10:00-10:35 AM EST
Track: Strategic AI

Claire Potter-Schneider

Head of AI Transformation, Dynatrace

- LinkedIn

Session Description

Most marketing teams have the pillars; few have the blueprint. This 200-level session skips the "why" of AI and dives straight into the operational "how." We move beyond foundational theory to explore the Architecture of Marketing Transformation - a strategic deep dive for leaders ready to evolve from experimentation to enterprise-grade integration.

Using my experience working in AI Transformation at two enterprise companies as the backbone, I will deconstruct how to transition your org from AI enthusiasts to AI Experts. The session will dive deep into these key areas:

- Enablement at Scale: How to push beyond the basics and into strategic roadmaps
- Strategic Governance: How corporate councils should drive AI impact
- Role Redesign: The audits and impact assessments that cultivate organizational change

Leave the surface-level hype behind and learn to build a scalable, high-impact marketing engine.

Key Quote

> *"The goal of governance is not to say no; it's to provide a clear path towards yes."*
>
> **- Claire Potter-Schneider**

Session Summary

Claire Potter-Schneider, who leads marketing AI transformation at Dynatrace, shared the playbook she built over three years at Motorola Solutions, where she created the AI transformation function from scratch and helped scale her approach into a corporate program across 35,000 employees. She opened with the results of Motorola's first AI pilot: 30 marketers delivered $750,000 in cost savings, 12,000 hours saved, and $1.5 million in pipeline in six months. Her point was that the pilot succeeded because of the transformation program running underneath it.

The first building block was governance. Potter-Schneider argued that "gates," which force employees to seek permission, push AI use into the shadows, while "guardrails" put the burden on leadership to define clear policies. She outlined a marketing AI council with a single chair and

rotating functional owners, a three-tier risk model for use cases, and a prioritization model that weighs cost, concerns, effort, impact, and time frame to produce a defensible roadmap for leadership. Every use case, she stressed, should carry its own KPIs.

The second building block was enablement, delivered in four phases: assess, communicate, educate, and activate. Assessment includes an anonymous benchmarking survey, functional interviews, a review of current use cases, a maturity model, and a state of AI report that informs goal setting with leadership. She illustrated the approach with Gemini Quest, a five-level gamified challenge that took Motorola marketing from essentially zero adoption to daily practitioner use; two years later, marketing was still second only to engineering in AI adoption, at 80%.

She then walked through the "three A's" she uses with leaders: augmentation, acceleration, and automation. At Motorola, she mapped the entire content creation process before a 30-license Jasper pilot began, which exposed weak spots and set a time baseline. For role redesign, a content audit revealed almost 9,000 hours a month spent on content creation, and an impact assessment agent, built on a martech stack audit, state of AI reports, job descriptions, and governance materials, maps each role's tasks to a current state, a future state, projected time savings, and next steps.

Potter-Schneider closed with a clear message: pilots have start and end dates, and on their own they will not drive successful AI adoption. In Q&A, she discussed matching specific LLMs to specific workflows, gathering time data manually from every marketer with leadership support, and prioritizing a budget agent because budget reconciliation was a pain point shared across the organization.

Key Takeaways

- **Guardrails beat gates:** Permission-based gates push AI use into the shadows, so leaders should define clear policies and examples that give teams a path to yes without asking permission.
- **Measure before you enable:** Anonymous benchmarking surveys, functional interviews, and a maturity model show where the organization actually sits rather than where leadership thinks it sits.
- **Structure and time drive adoption:** Gemini Quest's gamified, role-specific challenges made Motorola marketing a company leader in AI use, and giving people time to learn is the common thread behind a successful transformation.
- **Quantify the work to win leadership:** Showing that teams spent almost 9,000 hours a month on content creation turned the conversation from requesting buy-in to offering leadership a better alternative.
- **Build a program, not a pilot:** Pilots end, but the governance, enablement, and role redesign running underneath them are what make AI adoption last.
