01

Why Scale Content Performance Tracking?

You are now marketing to AI and humans

01

Buying a New Car

Use AI to Monitor Your Entire Digital Footprint

fire&spark

02

Automate a GEO Content Audit

Every hour: crawl, diff, decide, route

02

Enrich your content performance reporting with a **custom taxonomy**.

Healthcare Service Taxonomy

medical condition

A condition the service treats or manages.

"Acne"

symptom

A symptom or sign the service addresses.

"menopause symptoms"

service exclusion or limitation

Who or what the service does not treat.

"Insulin-dependent diabetes exclusion"

fire&spark

ENTITY GAP AUDIT

SonderMind

What the service pages say, and what they leave out

Domain: sondermind.com | Care model: **b2b2c_benefit, provider_network_marketplace** | October 06, 2026

75	32/57	3	4	1	33
ENTITIES FOUND	INFORMATION TYPES PRESENT	EXPECTED TYPES MISSING	SERVICES ANALYZED	SERVICES FULLY COVERED	SERVICE PAGES REVIEWED

Present | Mentioned, not offered | Expected and missing | Not expected for this care model

Services, one at a time

Each service is scored against the questions a buyer or an AI assistant needs answered: what it treats, how, by whom, in what setting, for whom, at what cost, how to start, and with what proof.

SERVICE

Therapy

Hub page: /therapy/

Individual, couples and online therapy with licensed therapists, matched or self-selected, in-network with major plans.

GEO Content Audit (prompt 1 of 3)

Research Entities for Healthcare Services

PROMPT

Prompt (Claude Cowork or Claude Code)

1) Fetch and scrape the list of digital health websites using the sitemap URLs provided. Use Tavily tools to fetch web pages.

2) Analyze the copy on every page of each website to extract the services they offer and build a taxonomy of attributes mentioned that describe the digital health service. These attributes should be generalized so they can be applied to any healthcare service delivered directly to patients online.

Scraping 400 Healthcare Websites for Service Attributes

Mental health
Talkspace
Headspace
Spring Health
Talkiatry

Weight care
Noom
Calibrate
Mochi Health
Found

Chronic care
Hinge Health
Virta Health
Twin Health
Oviva

Women's health
Midi Health
Evvy
Allara Health
Progyny

Care and pharmacy
Teladoc Health
MDLIVE
GoodRx
Capsule

Recovery
Bicycle Health
Ophelia
Pelago
Monument

GEO Content Audit (prompt 2 of 3)

Build the Taxonomy of Entities for Healthcare Services

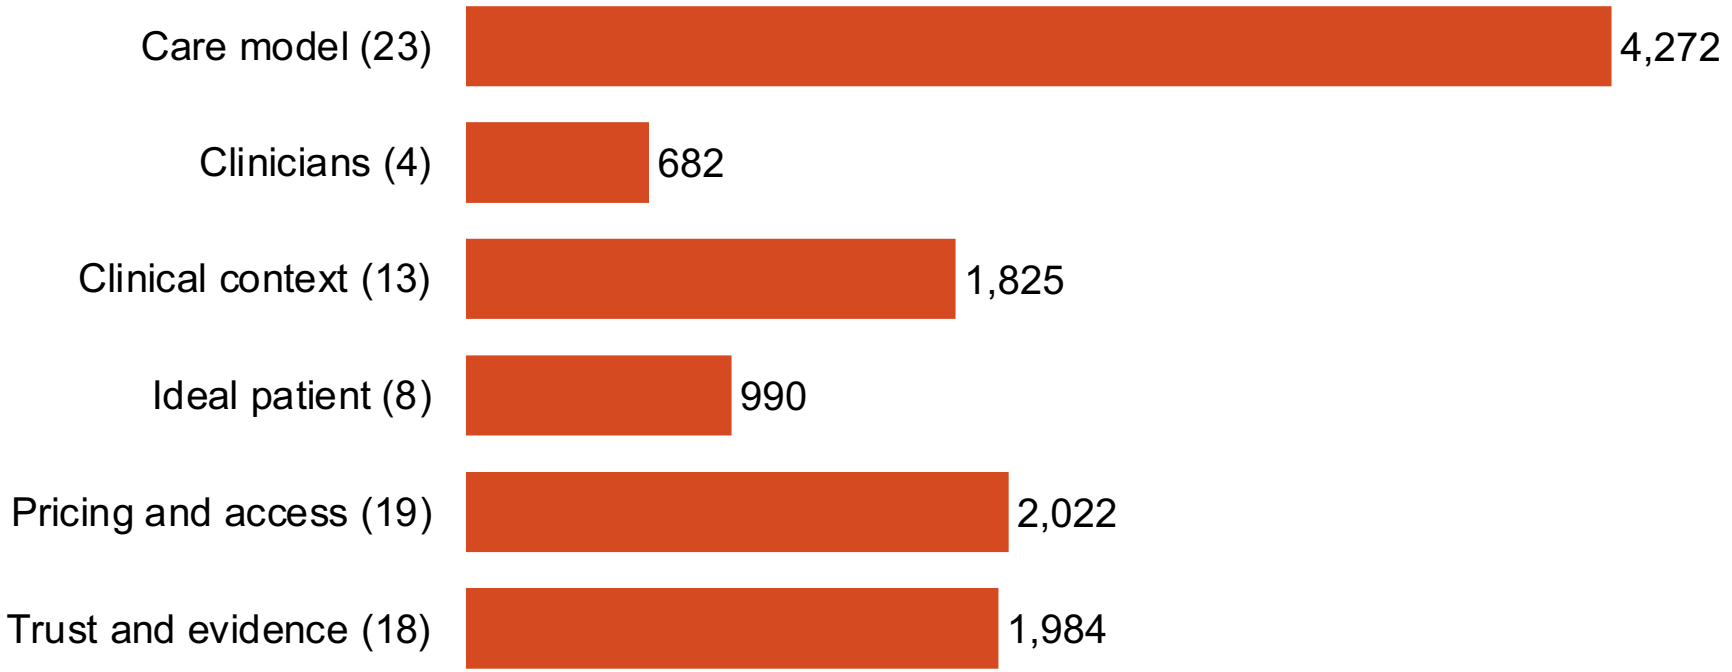

PROMPT

Prompt (Claude Cowork or Claude Code)

3) Build a taxonomy of generalized digital health service attributes that can be used to describe a digital health service

4) Determine the schema.org entities that map to each attribute.

Scraping 400 Healthcare Websites for Service Attributes

Scraping Healthcare Websites

Service and care model
23 attributes | 4,272 entities
service or program, care modality

People
4 attributes | 682 entities
clinician credentials, leadership

Clinical context
13 attributes | 1,825 entities
medical condition, symptom, risk factor

Ideal patient
8 attributes | 990 entities
population segment, eligibility criteria

Commercial and access
19 attributes | 2,022 entities
pricing model, insurance coverage

Trust and evidence
18 attributes | 1,984 entities
outcome claims, clinical studies

fire&spark

“Pricing Model” Attribute

pricing model

Price, billing period, membership or per-visit fees.

On 90 of 93 sites, 483 entities

Type Offer, UnitPriceSpecification

Fit Direct

Seen on cerebral.com: "$24/week billed as $95/mo"

fire&spark

```
{
 "@type": "Service",
 "name": "Medication plan",
 "offers": {
  "@type": "Offer",
  "priceSpecification": {
   "@type": "UnitPriceSpecification",
   "price": 95,
   "priceCurrency": "USD",
   "billingDuration": "P1M"
  }
 }
}
```

GEO Content Audit (prompt 2 of 3)

Build the Skill

PROMPT

Prompt (Claude Cowork or Claude Code)

5) Build a skill that takes a sitemap URL as input and fetches up to 50 pages that describe the services offered by the brand. Then, detect which attributes (and their schema) exists on the pages and what's missing. Then build a report that shows for each service the brand offers the attributes that are detected and what's missing, including schema that is detected and missing for each attribute.

SERVICE

Military Community Mental Health

Hub page: /military-mental-health/

Care program for veterans, active duty service members and military families; pages identified from navigation but not fetched in this run.

44%

of required information present

What is there

Care modality (site-wide)
In-person care; Virtual care

Demographics or Population segment or Life stage or physiological state or Eligibility criteria
Veterans active duty and military families

Pricing model or Insurance and payer coverage (site-wide)
Commercial insurance payers; Government and benefit plans; Self-pay rates

Enrollment steps (site-wide)
Intake questionnaire; Provider directory browse; Provider matching

Also on this service's pages

Service or program

What is missing

Medical condition or Symptom

Do you treat what I have? / Is this what I'm feeling?
Add to /military-mental-health/

Intervention type

How will you treat it?

Why Humans Build Monthly Reports

AI can continuously monitor your content for anomalies

03

Why?

Because they’re human

Your content performance reporting should **answer questions** on the **right cadence**

NOW

INSTANT ALERTS

Have any new pages hit 100+ visits?

7 DAYS

WEEKLY

Which content updates are producing results this week?

30 DAYS

MONTHLY

Which pages generated the most conversions this month?

04

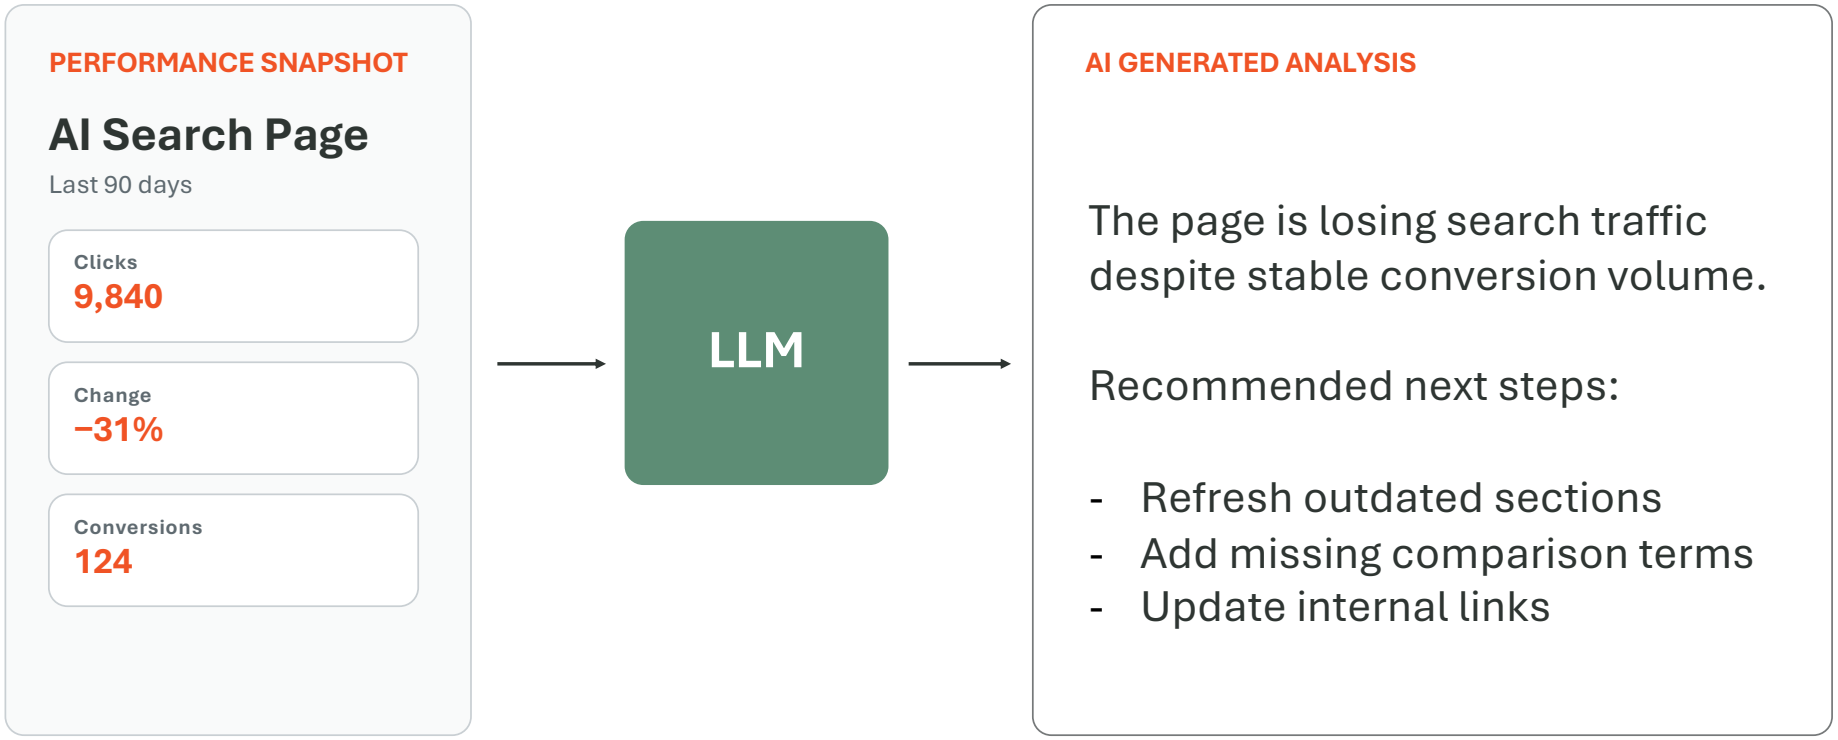

Continuous Content Monitoring

Spot anomalies and take action in near real-time

04

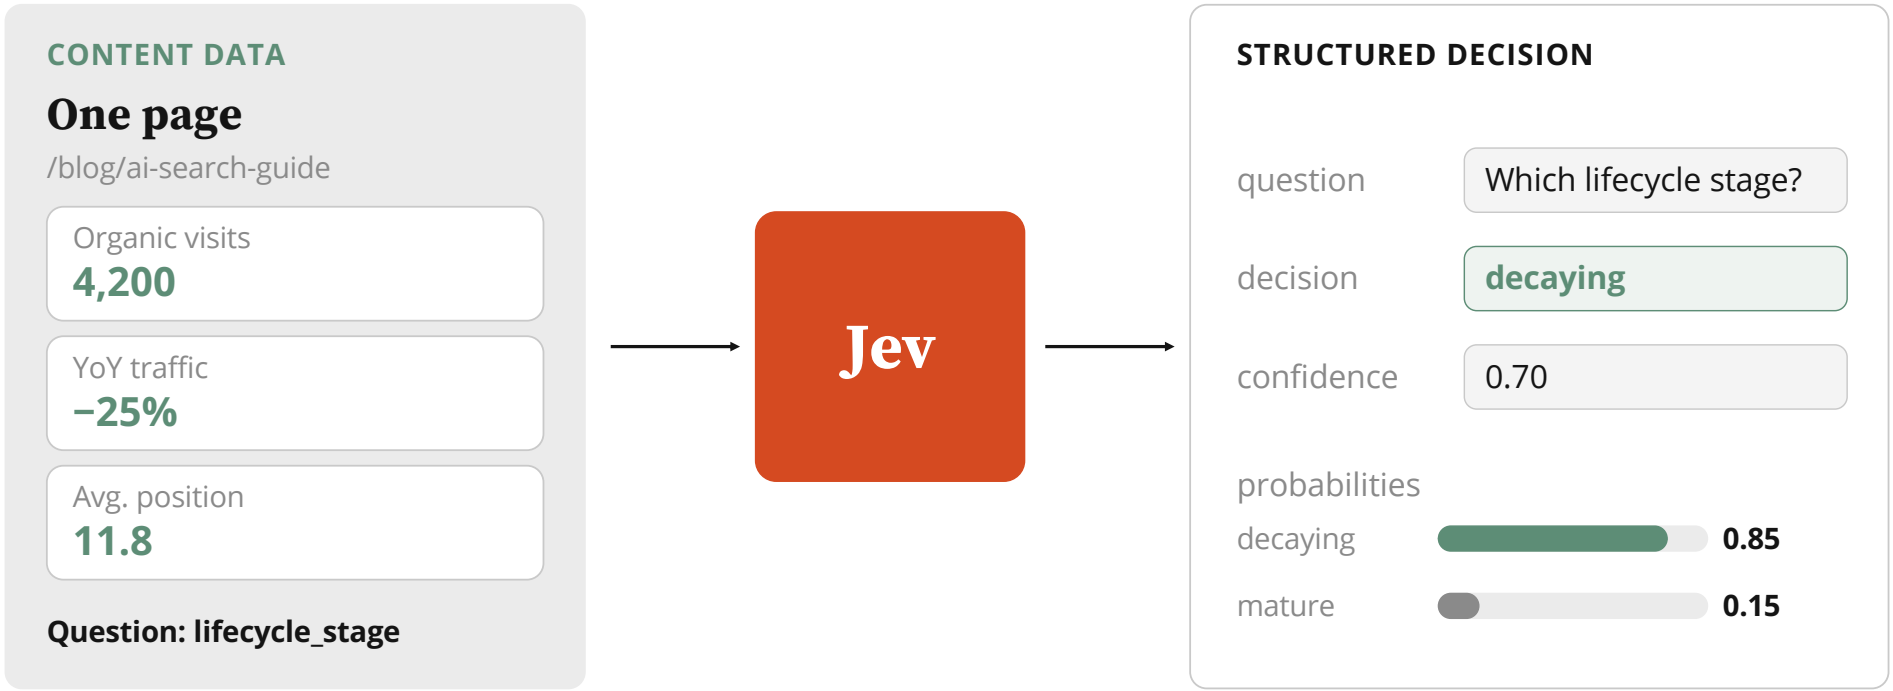

Traditional LLMs

Great at explaining content performance. Expensive for recurring analysis.

Jev

Content performance data goes in. A structured decision comes out.

Jev is NOT Generative AI

Jev does

- Makes decisions based on the context you provide
- Categorize pages fast
- Calculate probabilities for its decisions

Jev doesn’t do

- Generate content
- Crawl pages
- Access data directly

Use Cases: Content Performance Labeling with Jev

Attention leak

DATA: SEARCH CONSOLE

Identify pages where clicks fall well short of what that position should earn.

Visibility without demand

DATA: SEARCH CONSOLE

Identify pages that focus on a topic too small to move the needle.

Traffic without engagement

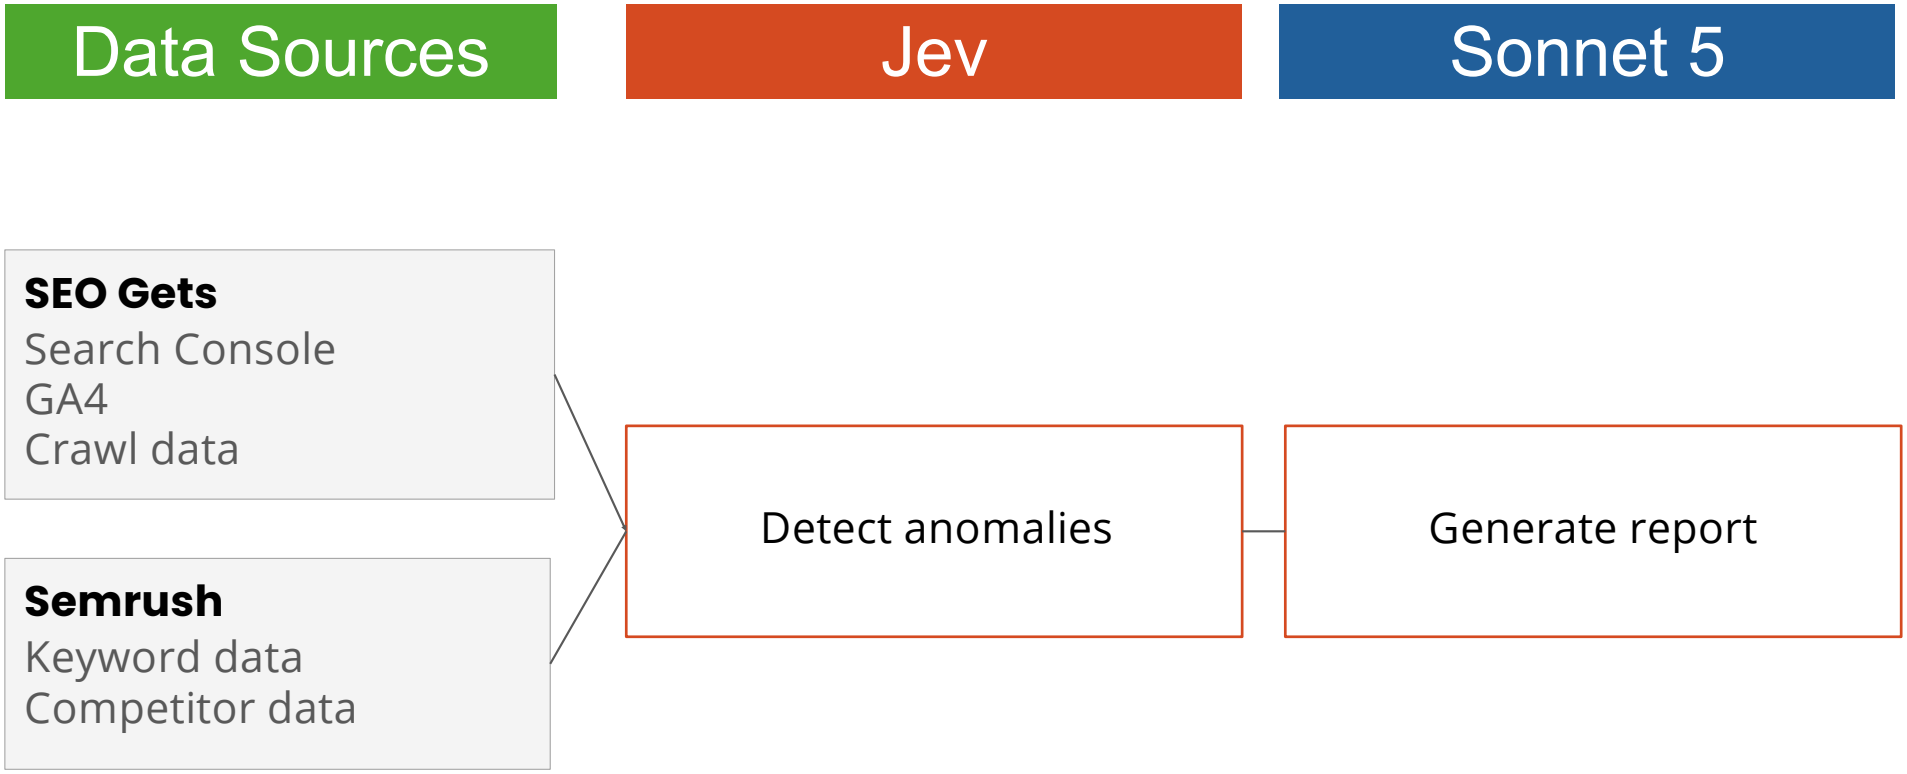

DATA: GA4

Identify pages with sessions but engagement rate that lags the median.

Engagement without reach

DATA: GA4

Identify pages where engagement is strong, but very few sessions land.

Data Sources
Jev
Sonnet 5
SEO Gets
Search Console
GA4
Crawl data
Semrush
Keyword data
Competitor data
Detect anomalies
Generate report

Jev Automation for Content Performance Tracking

List pages from website sitemap › Extract GA4 + Search Console data points › Jev labels URLs with decisions › **Craft a narrative based on Jev's output**

Prompt: Jev for Content Performance

Help me analyze the performance of my web content.

1) Use SEO Gets tools to pull GA4 and Google Search Console data for every content page.

2) Build Python that transforms the SEO Gets data into Jev inputs and calls the Jev API. Accept the Jev API key as a required command-line argument named --api-key. Do not hard-code or save the key in the script.

3) Create Jev decisions for meaningful traffic declines, traffic gains, search visibility declines, updated-content performance, conversion changes, and unusual performance patterns.

4) Store each page's source metrics, Jev decision, score, evidence, and explanation.

5) The script should run like this:

python monitor.py --api-key YOUR_JEV_API_KEY

What it looks like

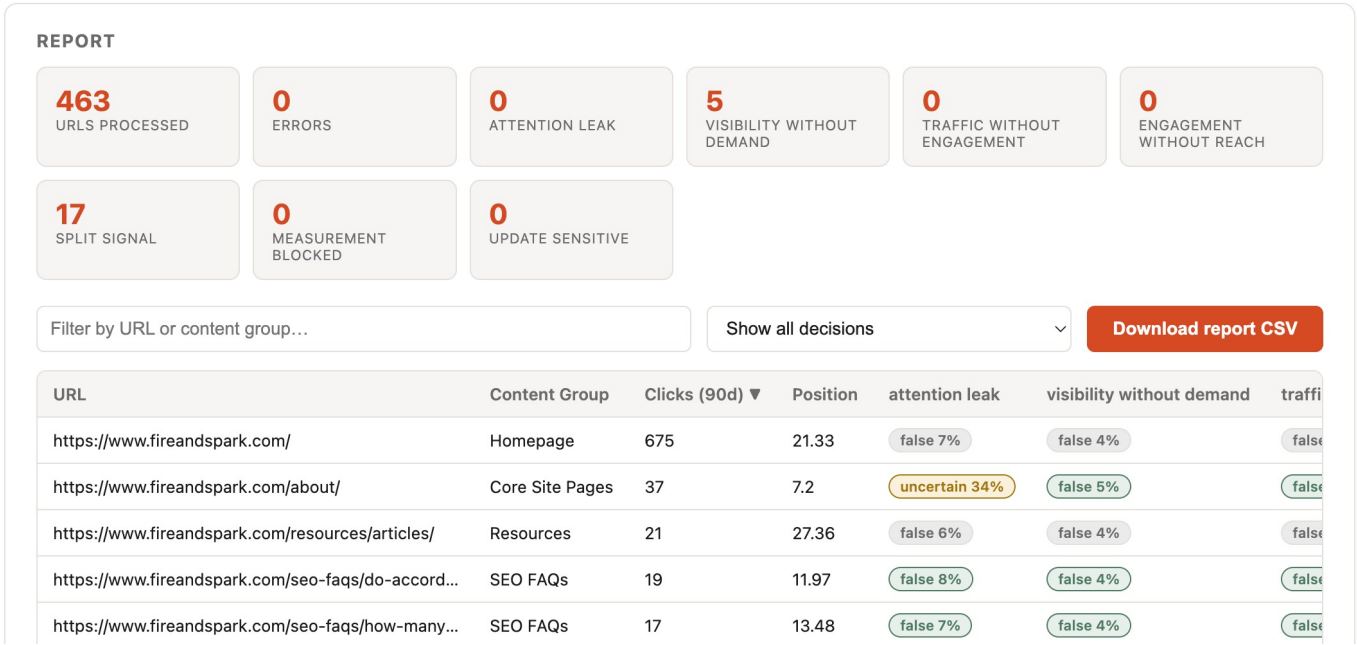

REQUEST

```
{
  "model": "jev-latest",
  "state": {"clicks_90d": 19, "clicks_prior_90d": 81},
  "questions": {"lifecycle_stage": {
    "type": "choice", "instructions": "Which lifecycle stage?",
    "criteria": {"decaying": null, "mature": null}
  }}
}
```

RESPONSE

```
{
  "model": "jev-1.13.0",
  "answers": {"lifecycle_stage": {
    "type": "choice", "choice": "decaying", "confidence": 0.7,
    "probabilities": {"decaying": 0.85, "mature": 0.15}
  }},
  "usage": {"input_tokens": 118, "output_tokens": 6}
}
```

05

Advanced Anomaly Detection

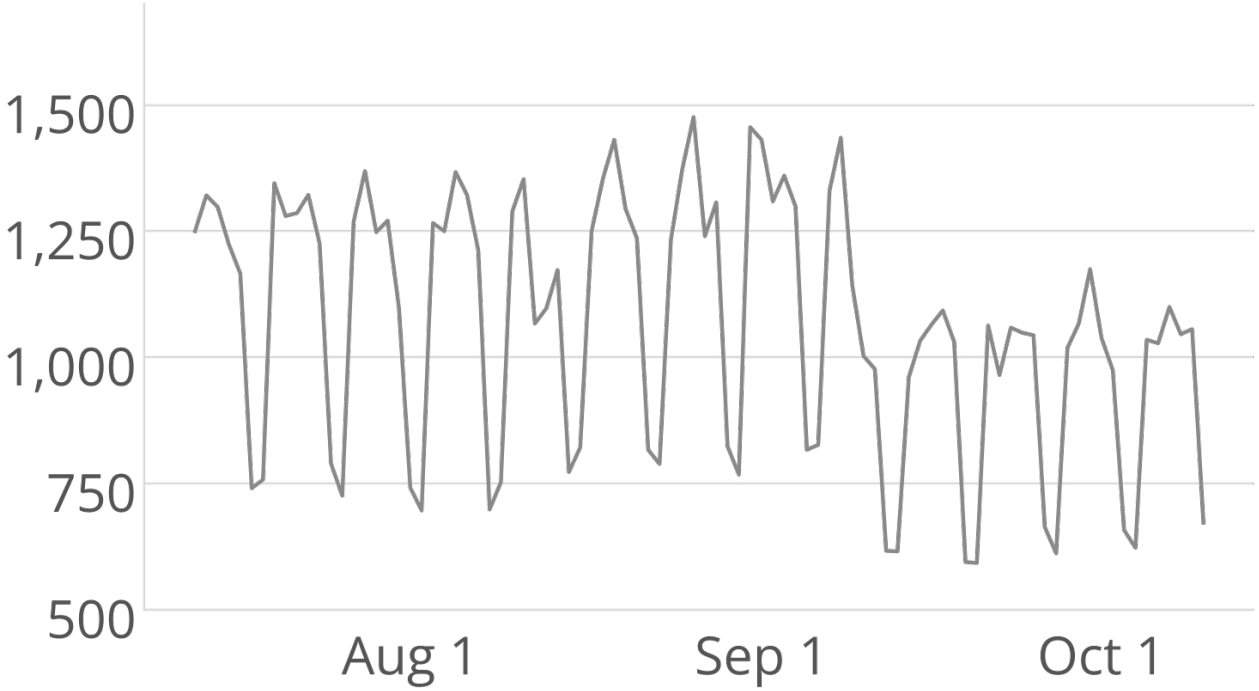

Avoid pitfalls of real-time alerts

05

Not every daily movement is meaningful

GA4 Anomaly Detection in Traffic Data

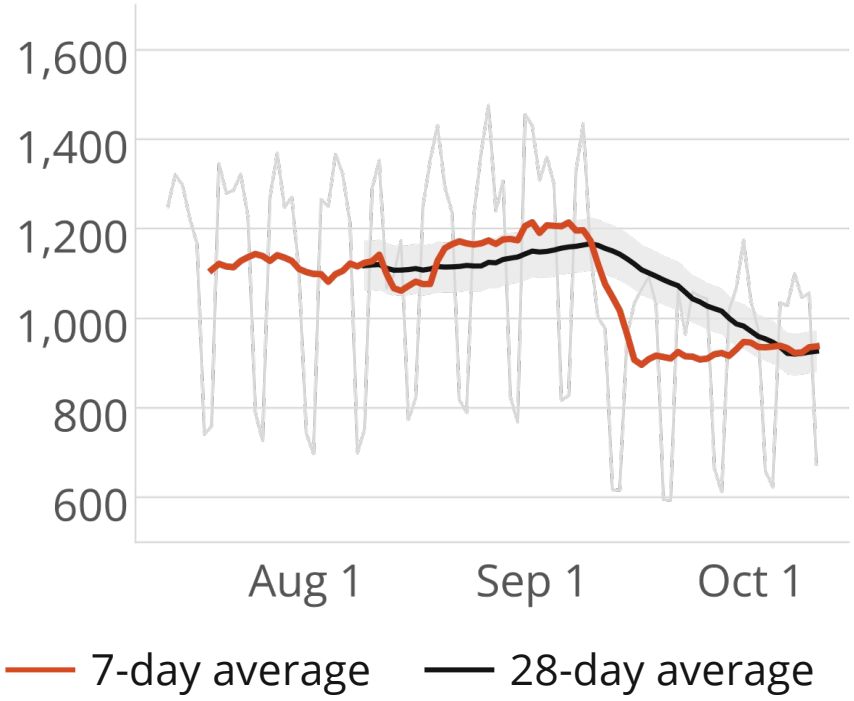

40%

weekday to weekend swing

24%

real drop, starting Sep 9

Compare the 7-day and 28-day Average

7-day average

What's happening now

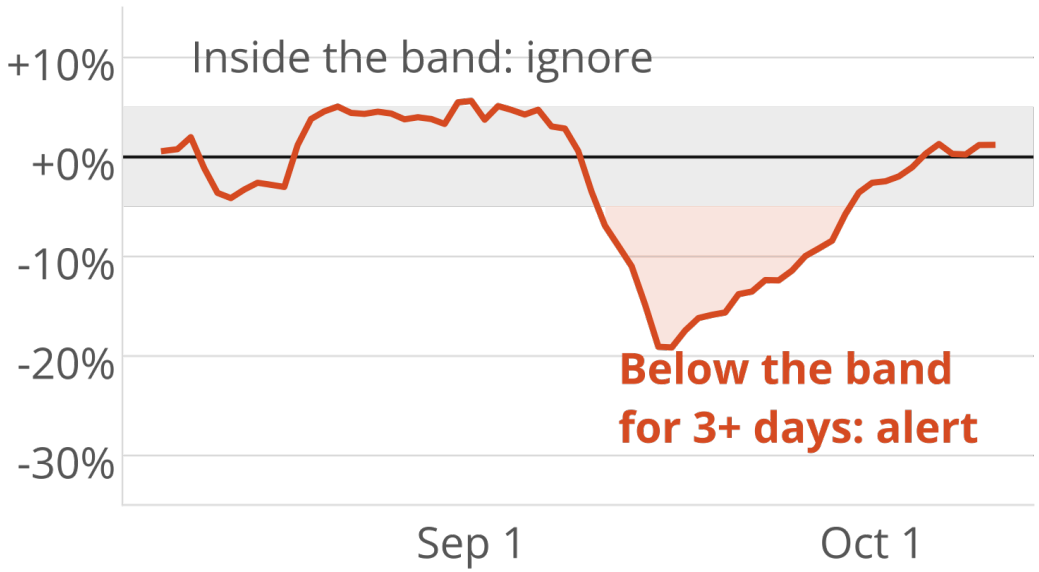

28-day average

What's normal

Crossover

Detect when "what's happening now" deviates from "what's normal"

Three filters that quiet noisy alerts

Band

Ignore gaps inside 5 percent of the baseline

Persistence

Alert only after 3 consecutive days outside

Magnitude

Rank alerts by traffic at stake

Training for your team

- AI-driven GEO workflows
- Content refreshes at scale
- AI-driven content workflows
- Discover niche topics in the wild
- Build persona variants for AI
- Earn co-citations with digital PR
